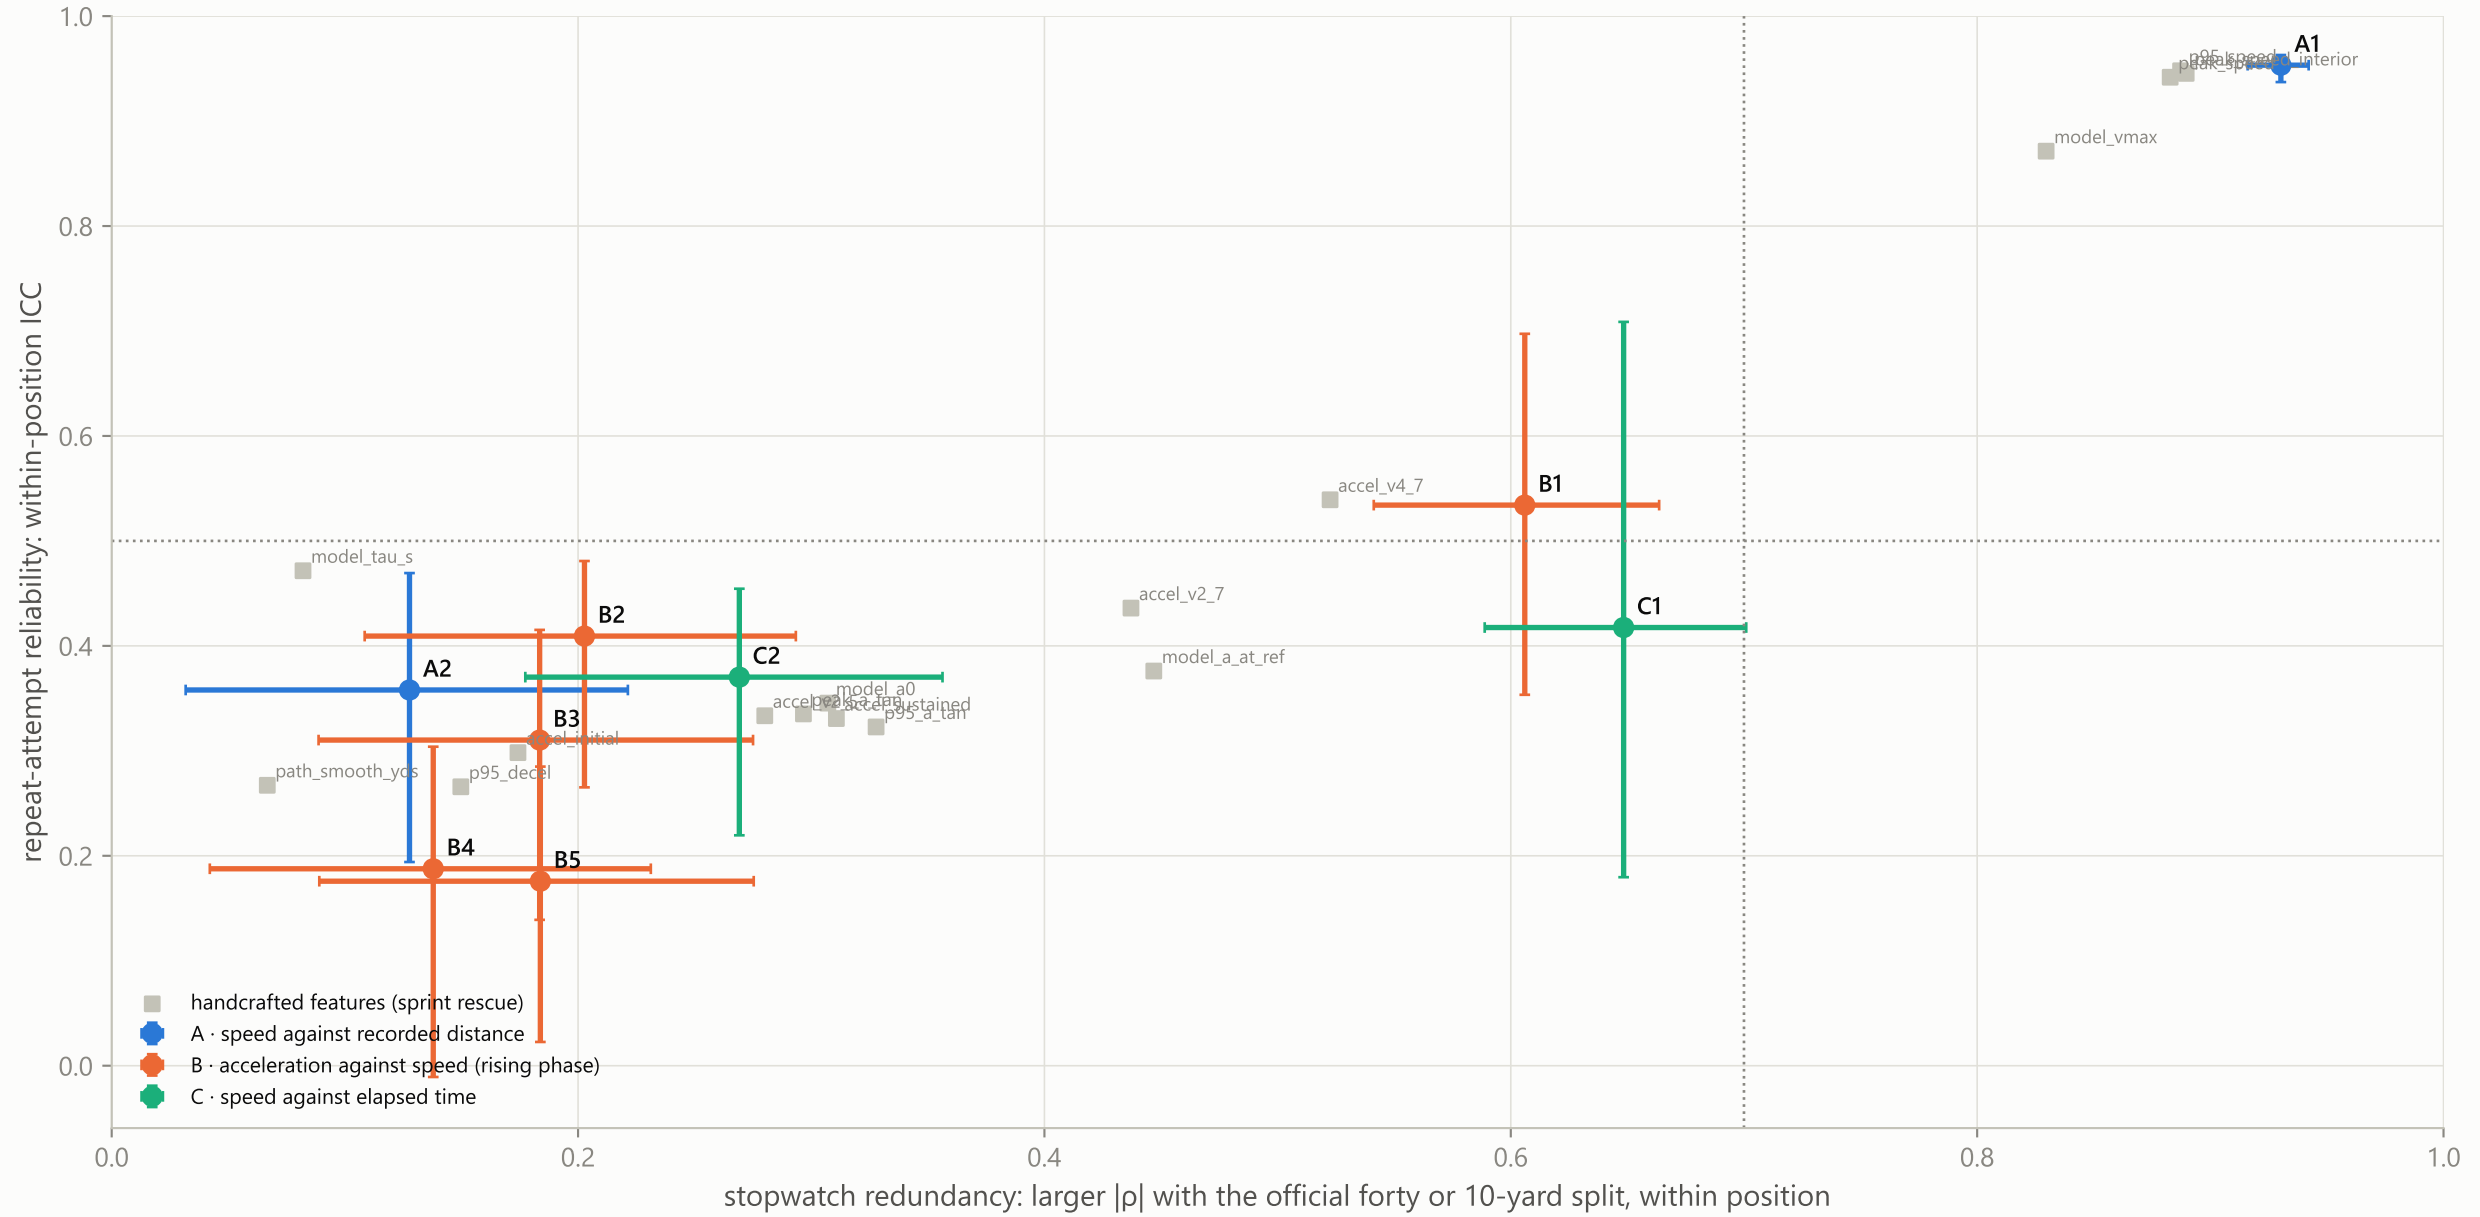
Reliability against stopwatch redundancy



Unit: athlete (up to n = 375 with a repeat). Each labelled point is one FPCA component at the benchmark K (letter = representation, number = component), with 95 % intervals. Upper left = repeatable and not explained by the stopwatch. Dotted lines are heuristic reference lines (ICC 0.5, |ρ| 0.7), not acceptance thresholds. Grey squares: the handcrafted forty features of the executed sprint rescue, for scale.
