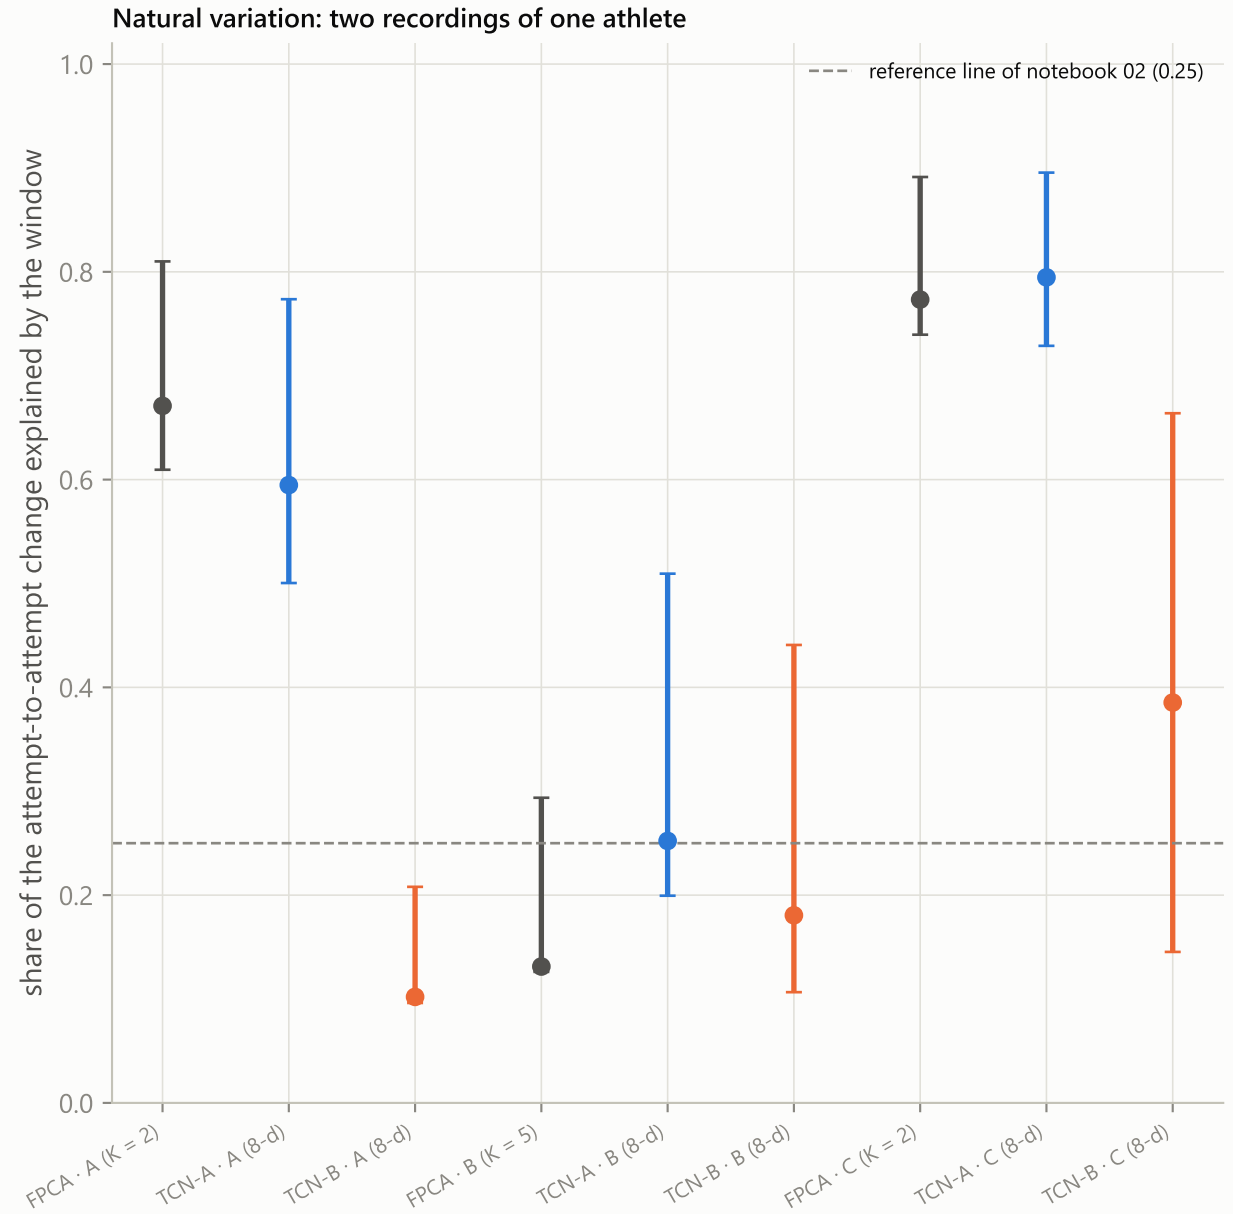
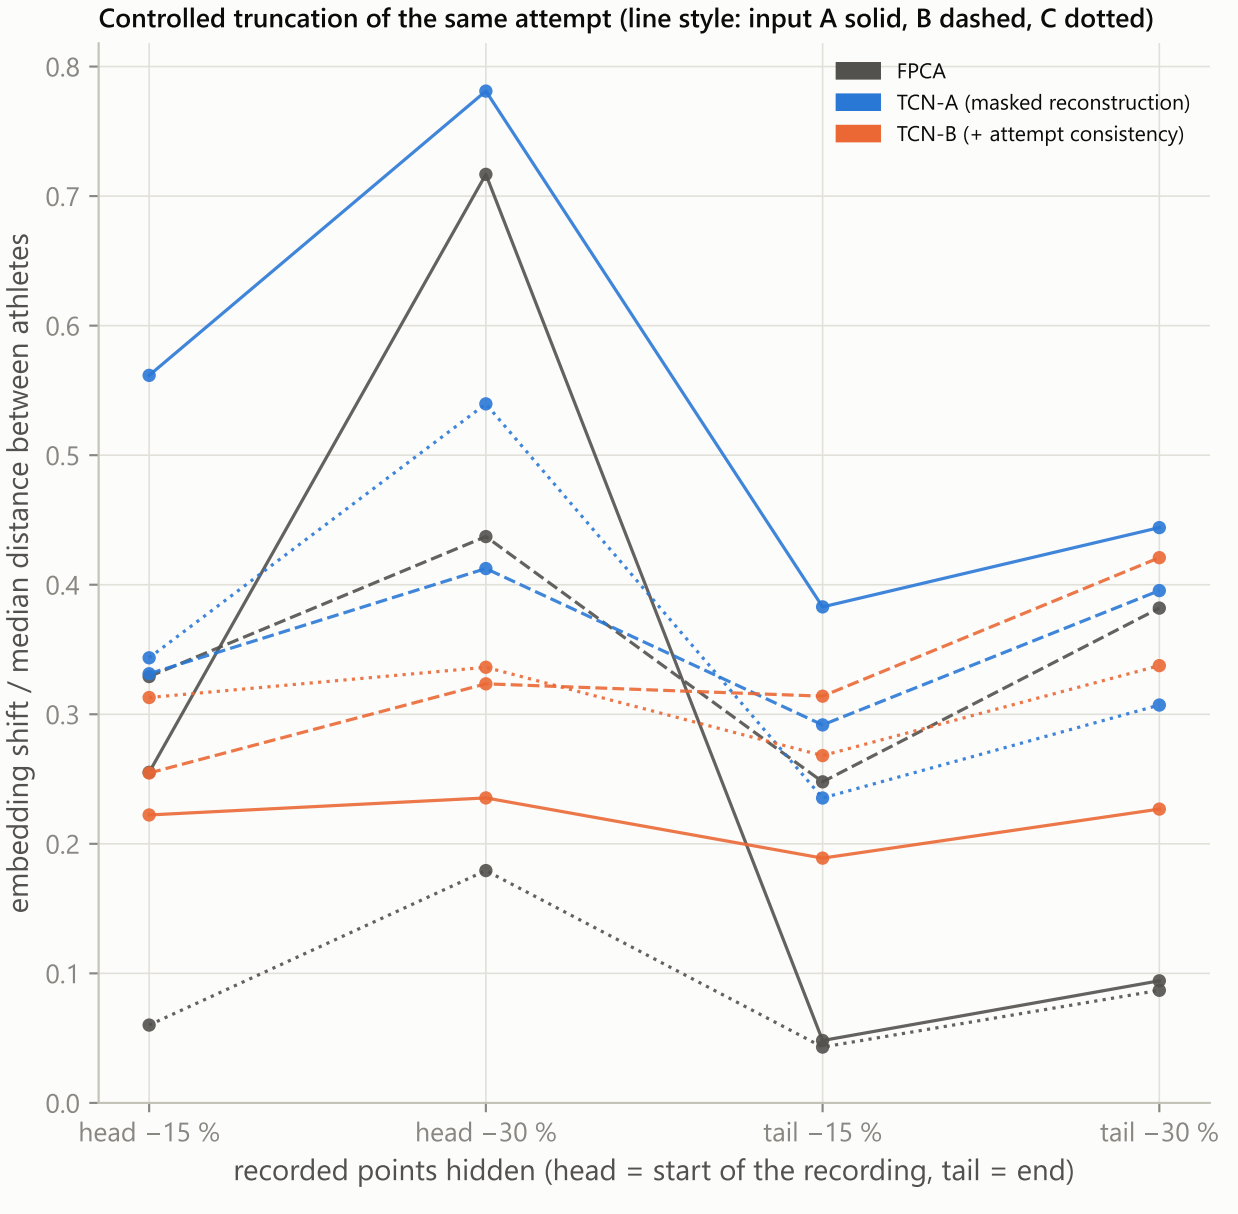
Dependence on the recording window





Left, unit: athlete with two attempts (n up to 375): the change of his embedding between attempts regressed on the change of first-frame speed, recorded duration and frames after the peak (trace R^2, in-sample as in notebook 02, whisker = 95 % athlete bootstrap). An athlete does not change between attempts; his recording does. Right: the same held-out attempt embedded with part of its recording hidden; a shift near 1 moves it as far as another athlete.
