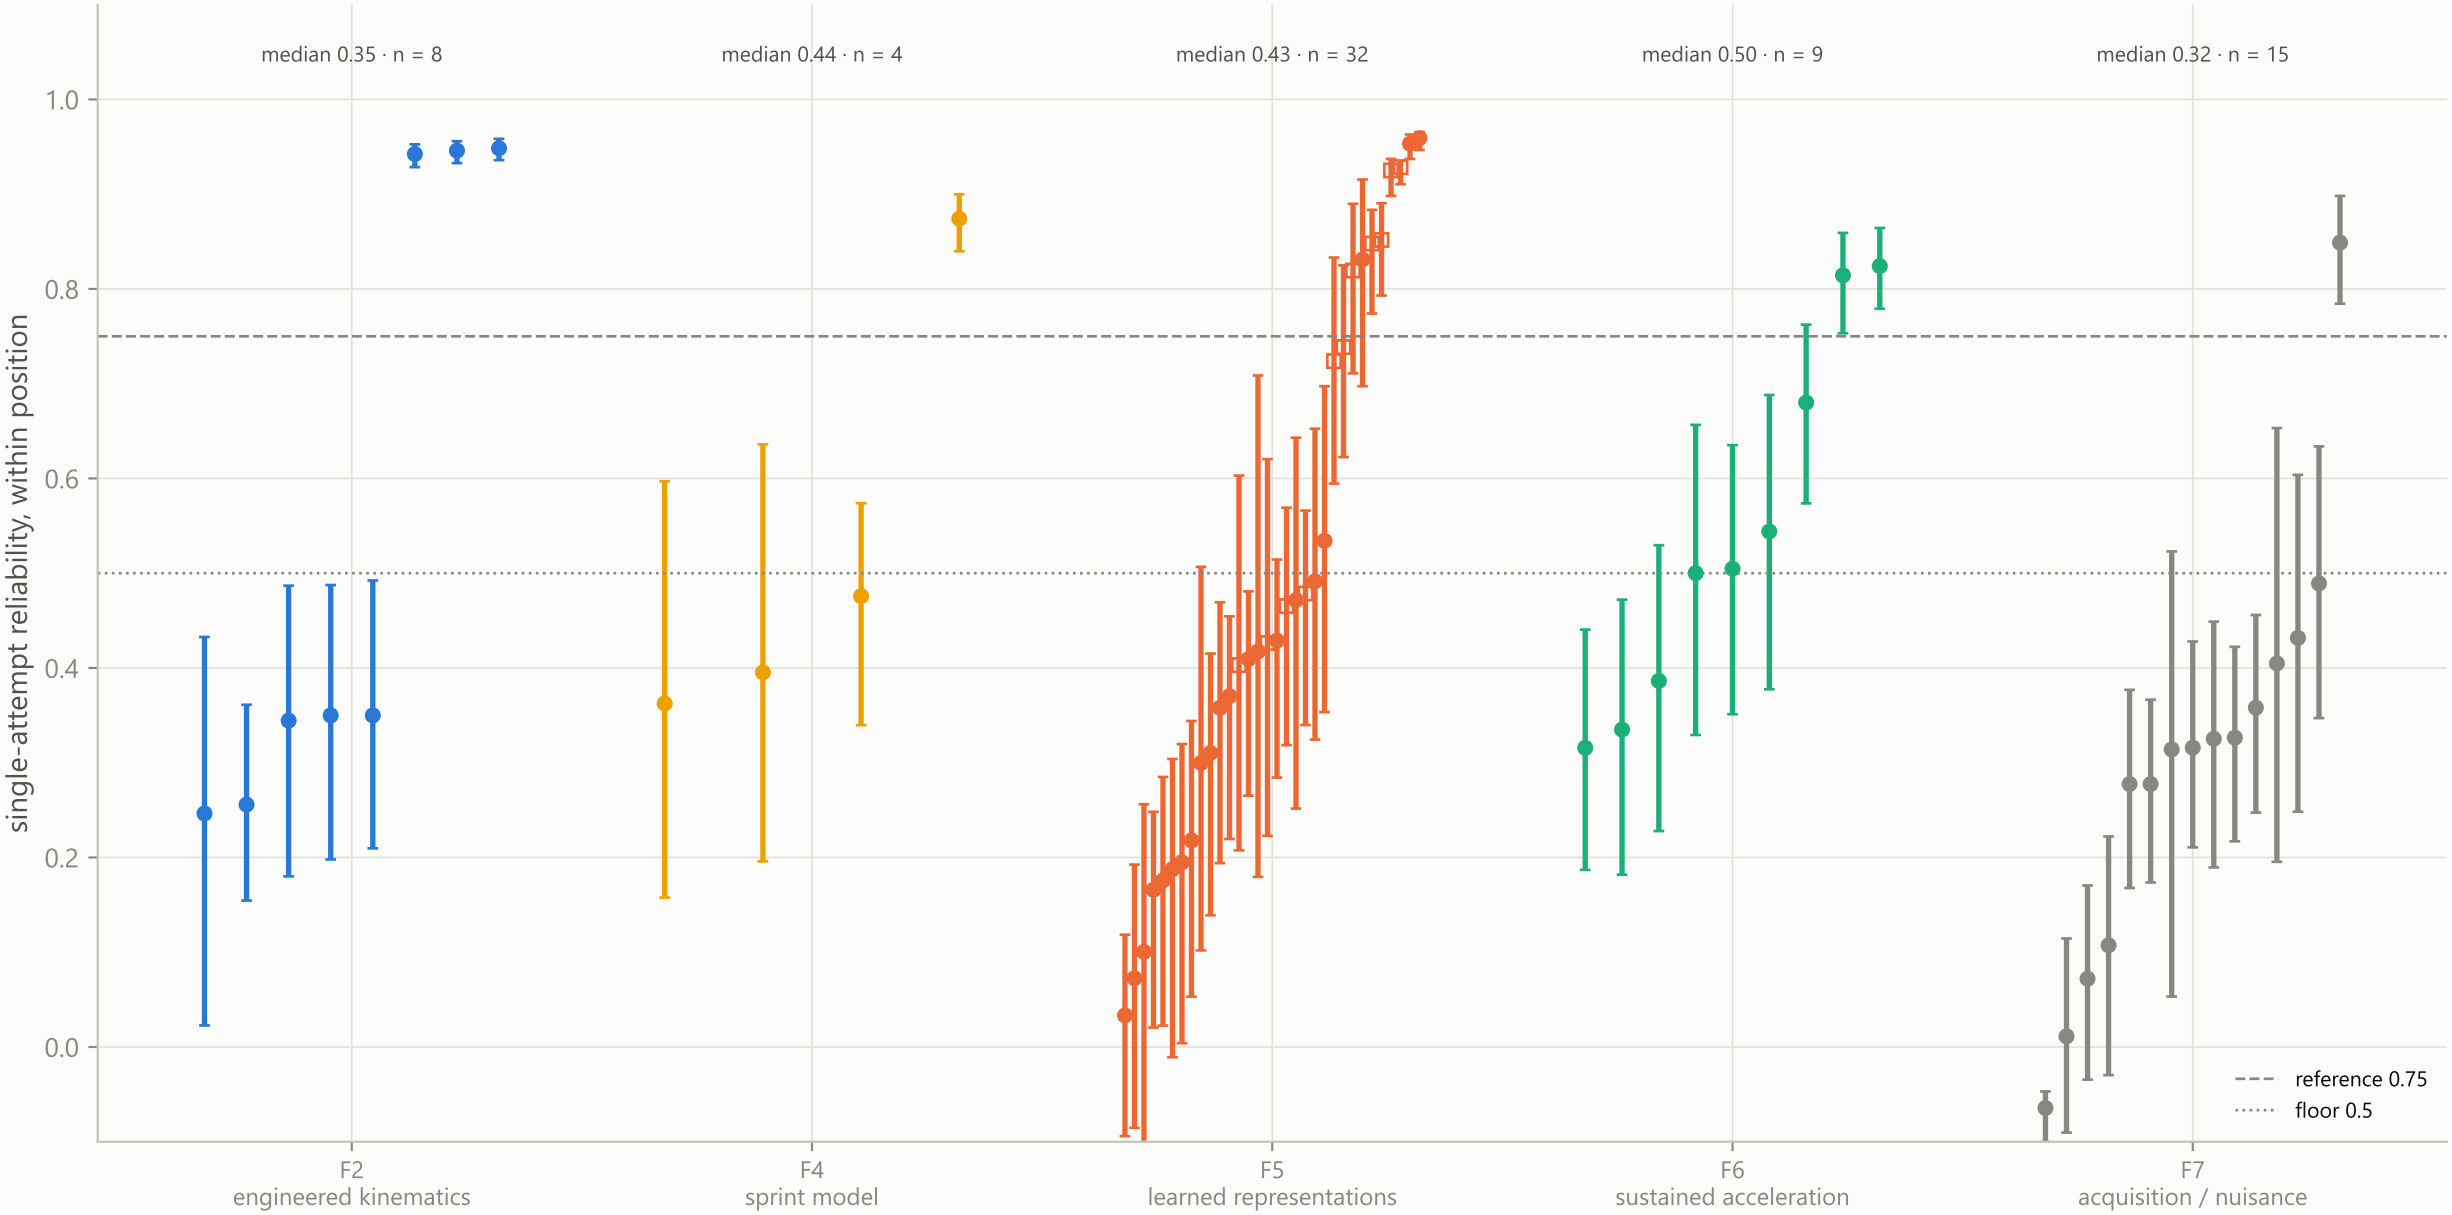
Reliability distribution by feature family



Unit: athlete (up to 375 with a repeated attempt). One marker per feature, sorted inside its family; whisker = 95 % athlete bootstrap. Filled circle = stratified ICC(1) of a scalar; open square = trace reliability of a whole vector (rotation-invariant; a different estimator, shown for context and never compared coordinate by coordinate). F7 are acquisition variables: their repeatability describes the recording set-up, not the athlete.
