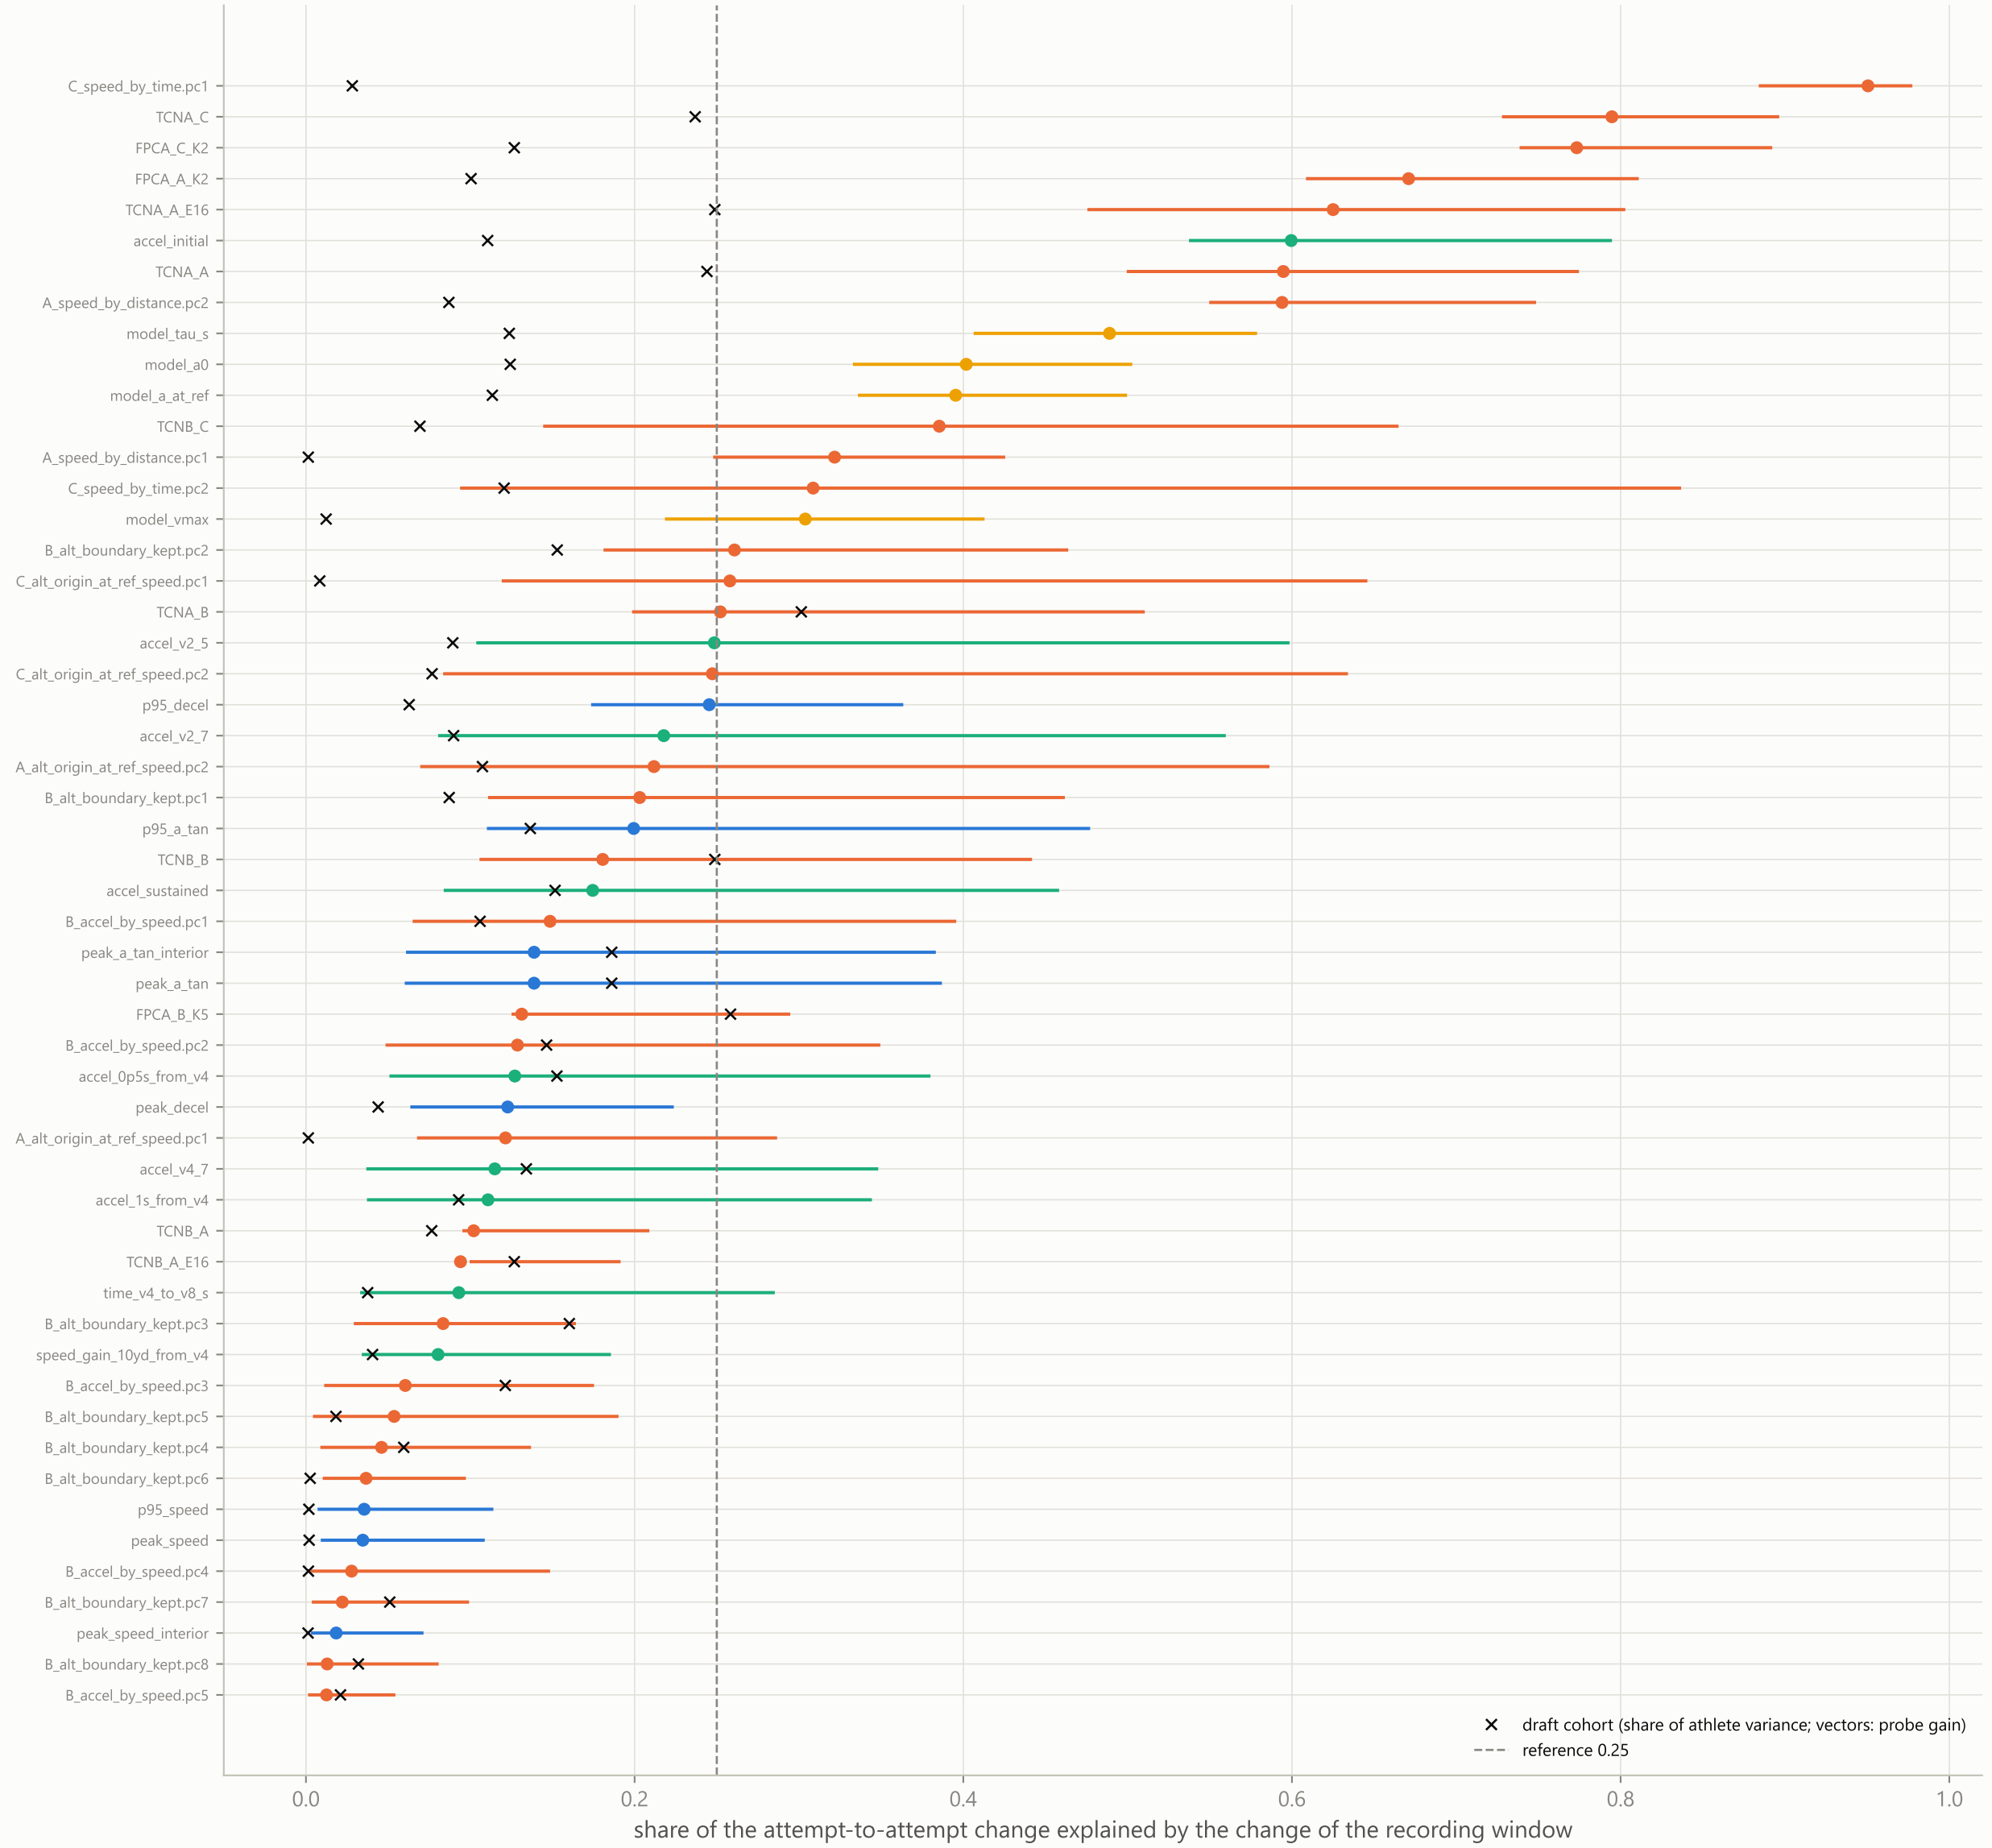
Recording-window sensitivity of the candidate features



Unit: athlete with two attempts (up to 375). Dot = R^2 of (attempt 2 − attempt 1) of the feature on the change of first-frame speed, recorded duration and frames after the speed peak; bar = 95 % athlete bootstrap. An athlete does not change between two attempts, his recording does: a large share means the feature follows the recording. Cross = dependence on the draft cohort (sensor generation). Colour = family; vectors use the trace R^2 of notebook 03.
