Feature redundancy matrix and interpretable clusters

Unit: tracked athlete (official value, or mean of the athlete's attempts; pairwise-complete, position means removed). Black lines separate the groups joined by average linkage while their mean |ρ| is at least 0.7: 5 group(s) of more than one feature. ● = member with the highest reliability, the natural representative. Three acquisition variables are included on purpose: a feature that groups with them follows the recording.
