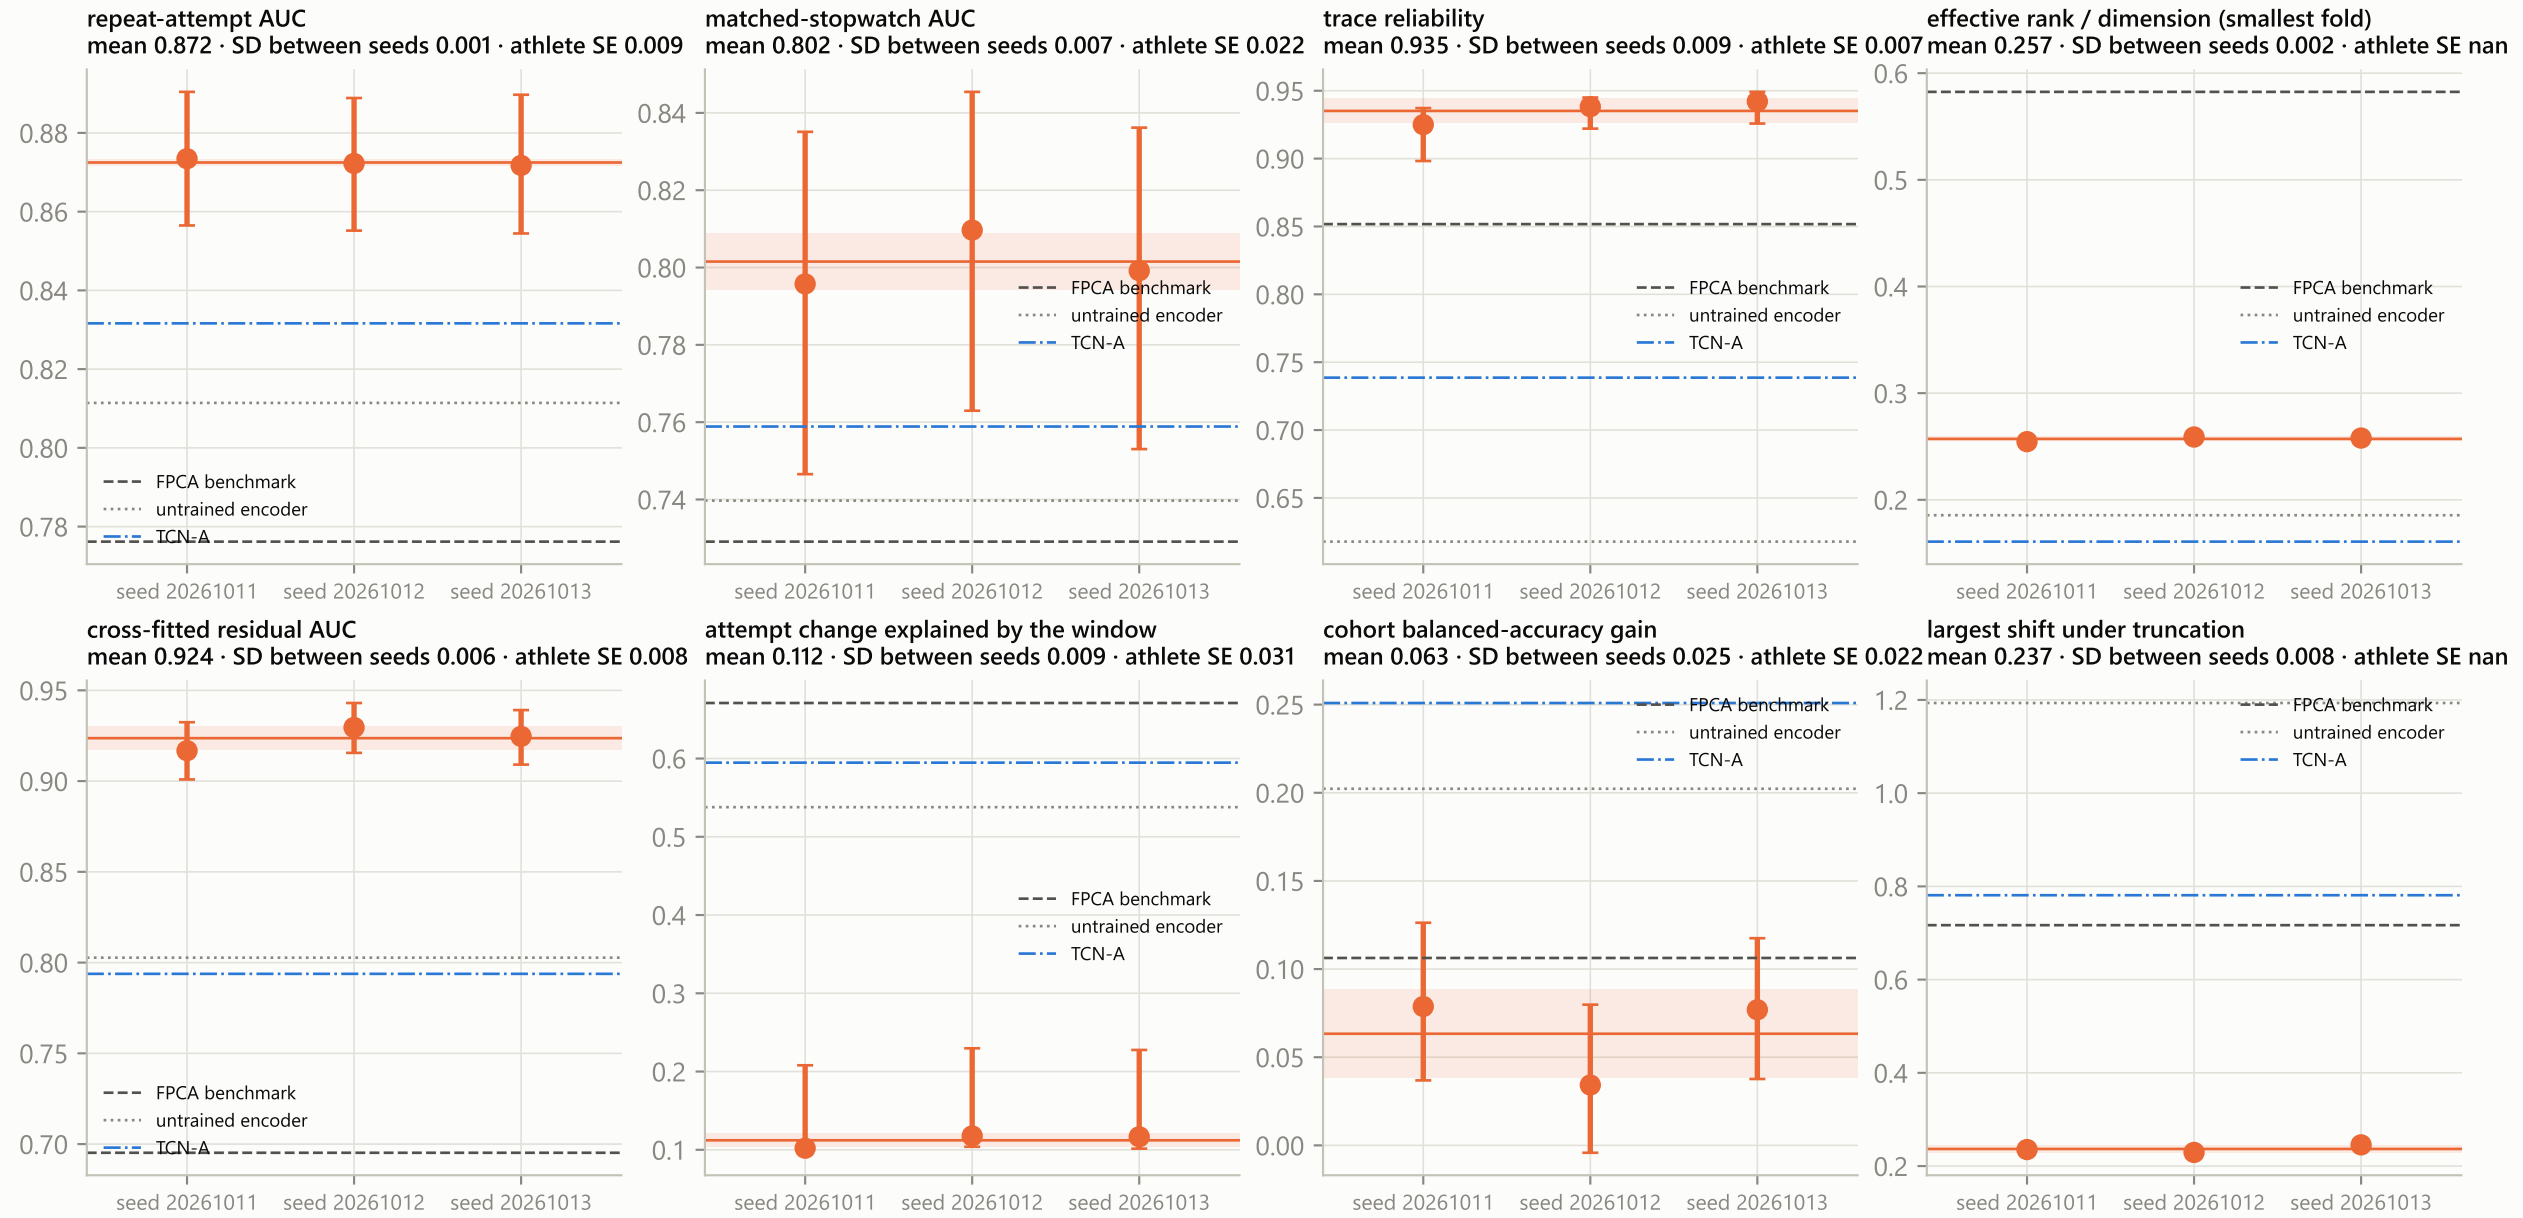
Three-seed robustness of the primary encoder



Unit of a dot: one training seed of the primary encoder (same architecture, optimiser, budget, input, folds and augmentations; only initial weights, batch order, masks and noise differ). Whisker = 95 % athlete interval of THAT seed (athlete sampling). Orange band = mean ± SD between seeds (training variability). The two are different sources and are reported side by side, never merged. No seed is selected: the first one was declared primary beforehand. With three seeds the SD is a rough figure.
