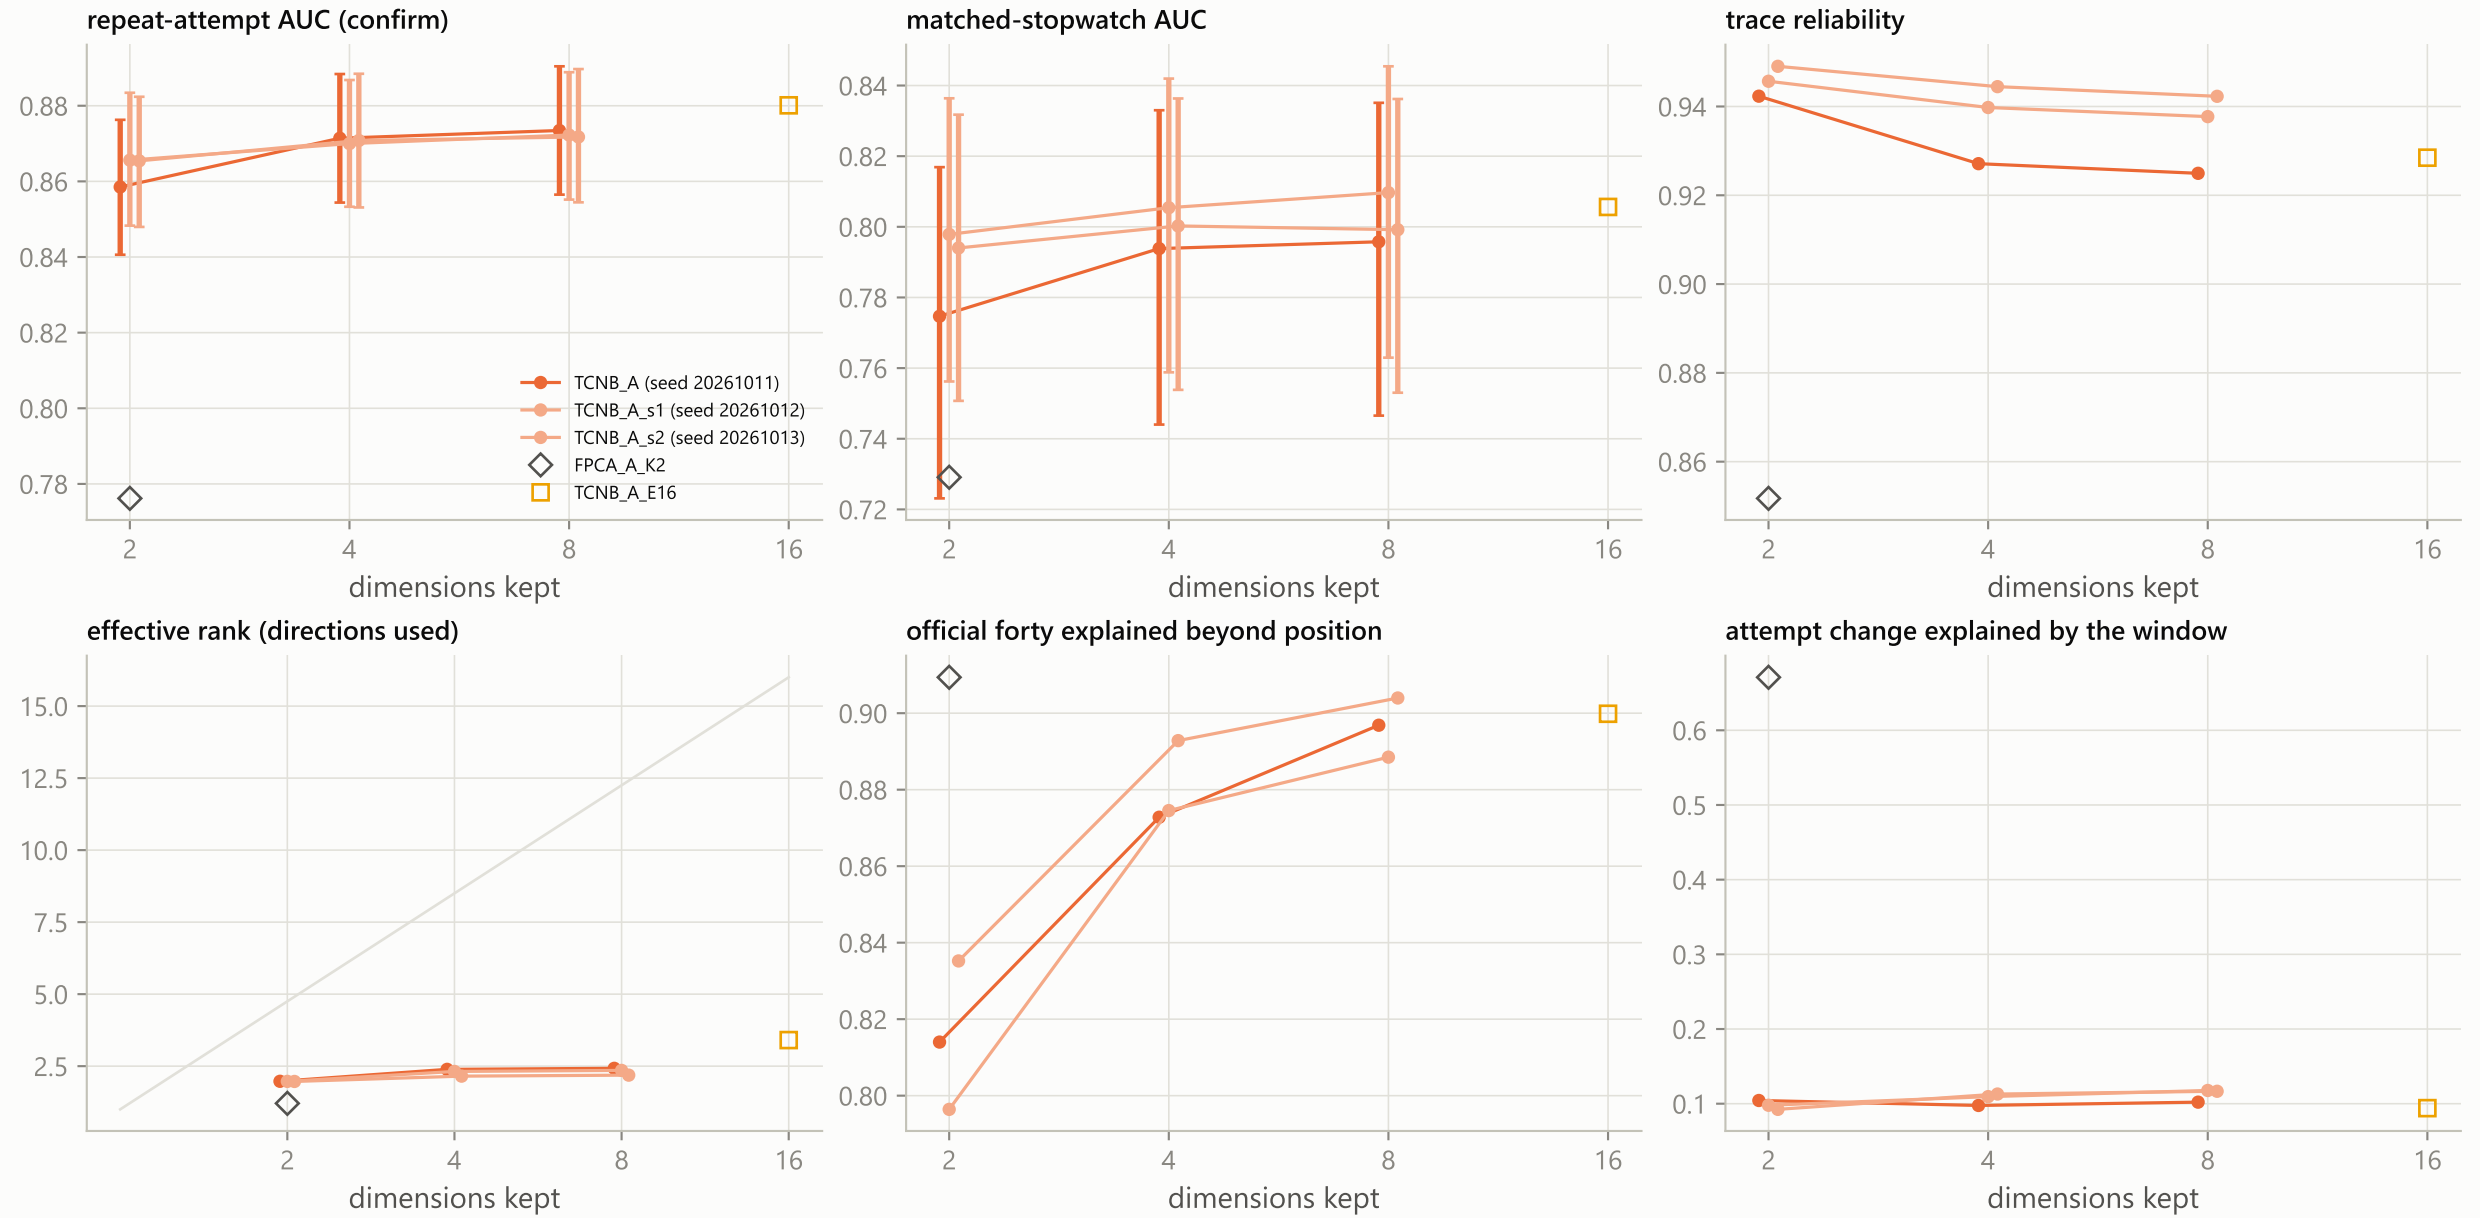
Effective dimension against stability



Unit: athlete (AUC panels: confirm-role athletes; whiskers 95 %). Lines: each training seed of the primary encoder, its embedding projected on the first k principal axes of the fold's TRAINING embeddings (k = 8 is a rotation of the original and reproduces it). Axes of different seeds or folds are never matched to each other. Open diamond = FPCA benchmark at its own K; open square = natively trained 16-dimensional sensitivity model. Grey diagonal on the rank panel = every kept direction used equally.
