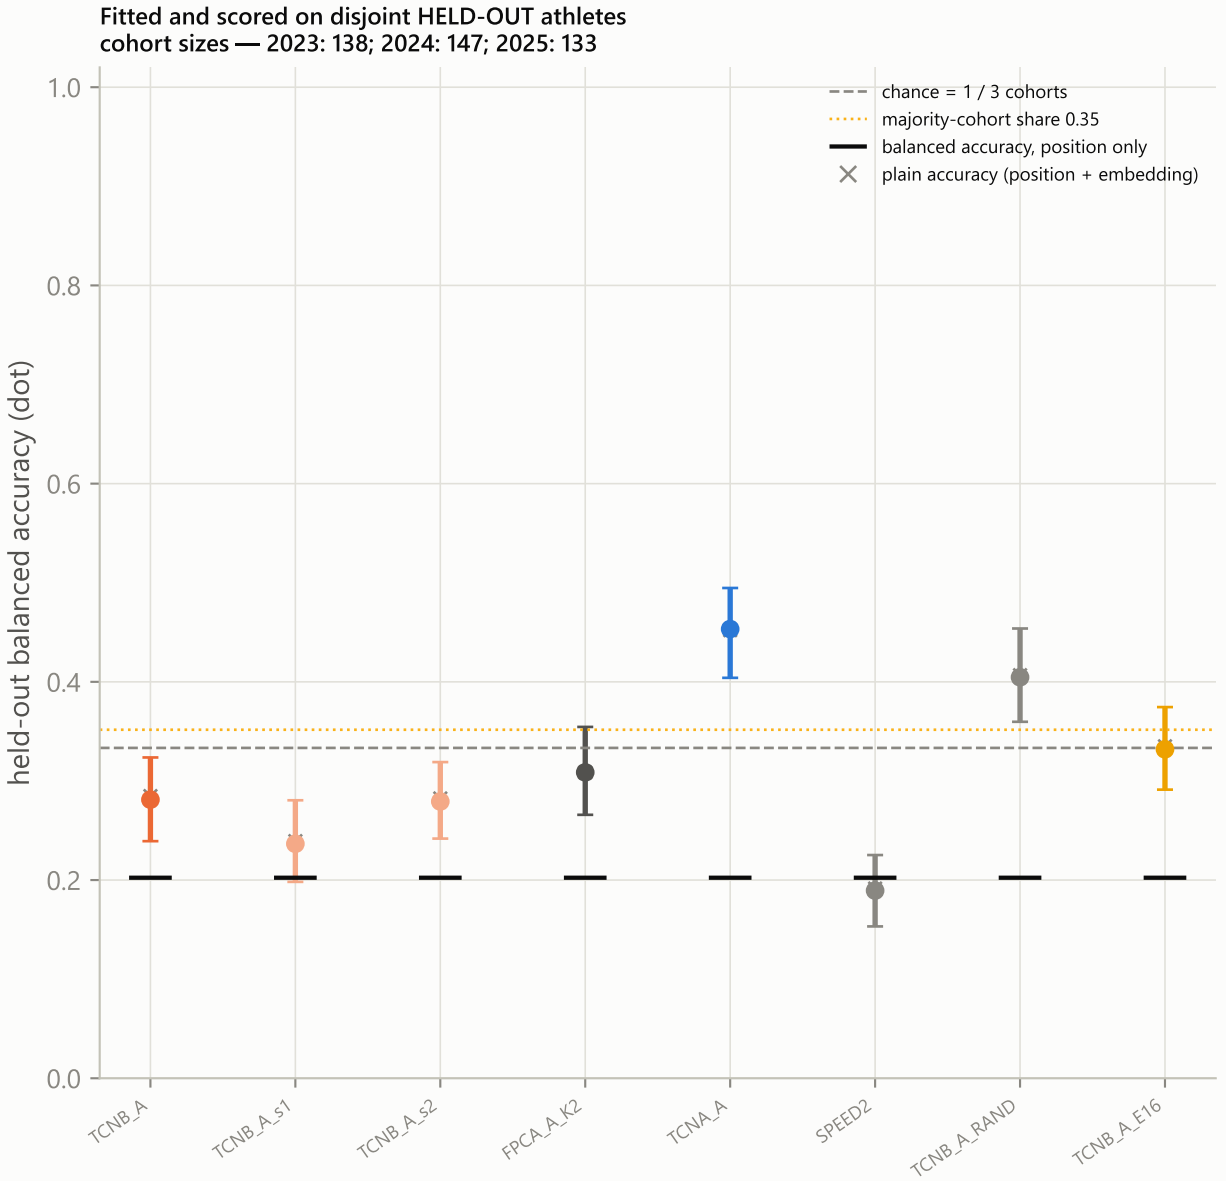
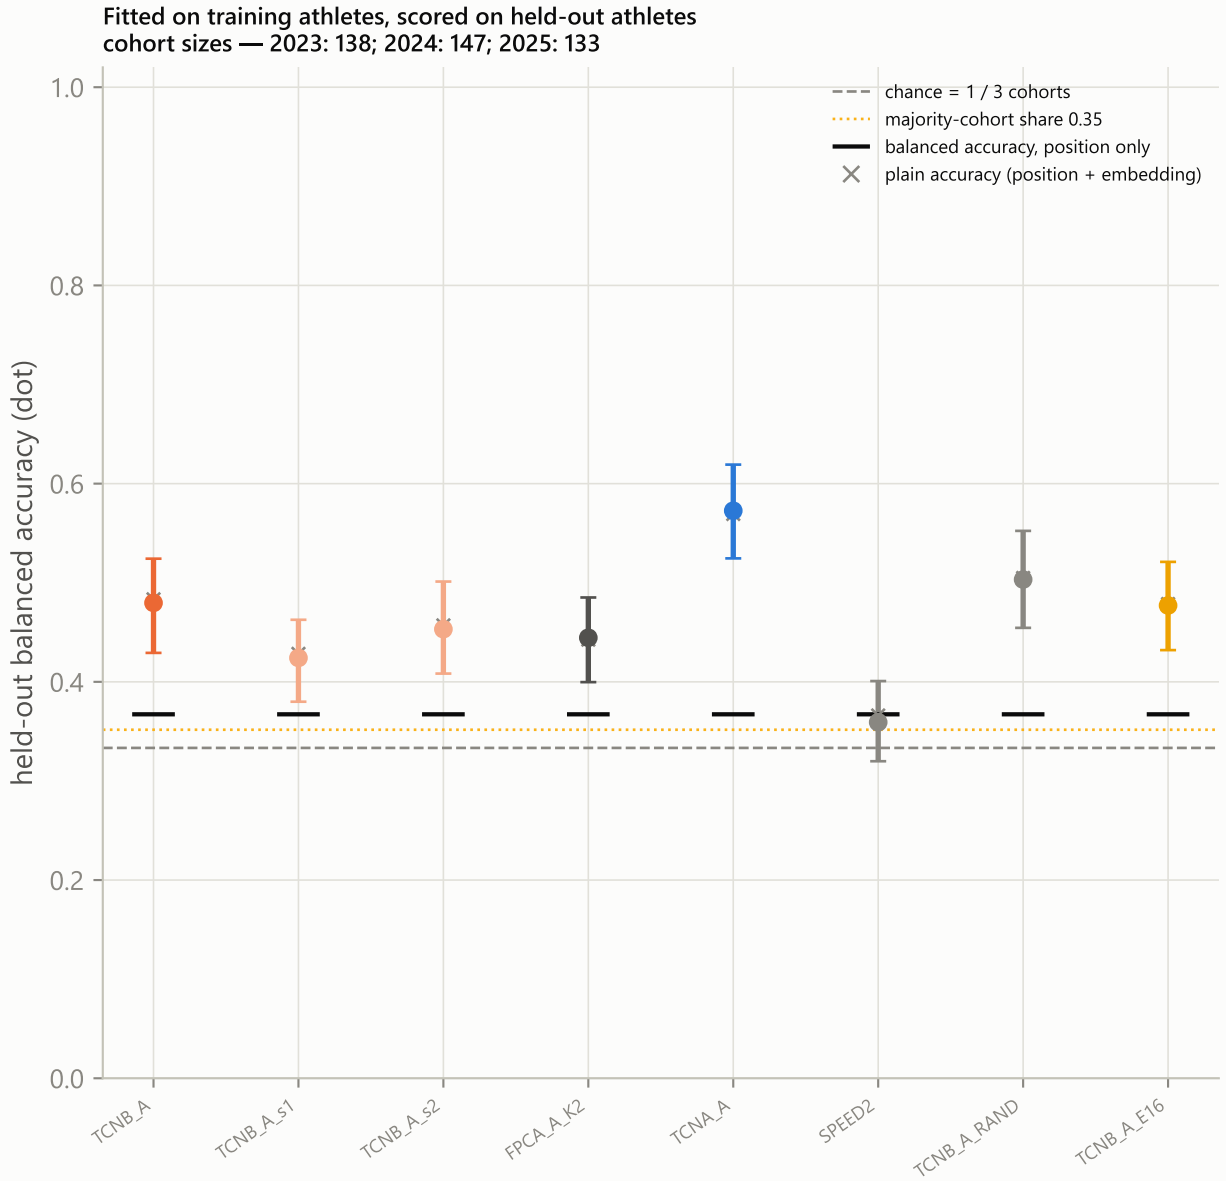
Draft-cohort probe against its baselines





Unit: athlete (n up to 418; athlete = mean of his held-out attempt embeddings). Ridge probe of the draft cohort. Dot = balanced accuracy (mean recall over cohorts) of position + embedding, with a 95 % athlete bootstrap; bar = the same probe with position alone. A dot well above its bar means the embedding carries the recording year (the 2025 cohort has about a quarter of the positional noise). Plain accuracy is shown only to make the effect of class imbalance visible: it must be read against the dotted majority line, balanced accuracy against the dashed chance line.
