Evidence hierarchy of the research programme

evidence level	claims read from an executed artifact	pending
measurement validated	C01 Tracked top speed (p95) of the forty is highly repeatable between attempts; C04 Tracked top speed is largely the same information as official testing; C09 NFL movement windows are dominated by context and opportunity, not by the athlete; C10 Only large incremental effects were detectable in the Milestone 06 design; C13 Gate B of the primary football outcome (game-split reliability and support); C16 Detectability of an incremental effect in the football cohort	—
descriptively repeatable	C02 Speed development (time from 4 to 8 yd/s) is repeatable and only partly explained by the stopwatch; C05 The speed-by-distance curve of a forty is low-dimensional; C06 TCN-B recognises an athlete's repeat attempt: a repeatable movement fingerprint; C07 The fingerprint still recognises the athlete among prospects with near-identical official results; C18 The scouting scorecard is descriptive, uncertainty-aware and abstains where evidence is missing	—
incremental information demonstrated	C17 Combine tracking characteristics that stay repeatable after official tests are accounted for	—
exploratory association	C11 Recorded receiver separation is a reliable athlete-level quantity with usable linked support; C12 Football-outcome registry decision	—
nfl predictive improvement established	—	—
unsupported or unresolved	C03 Peak tangential acceleration is NOT repeatable enough to describe an athlete; C08 TCN-B did NOT establish an improvement of held-out NFL sustained-acceleration prediction beyond official testing; C14 Primary football transfer comparison (engineered speed development beyond official testing); C15 Secondary football transfer comparison (TCN-B beyond official testing); C19 Get-off cannot be used as an outcome; C20 Cohort size a future study needs	—

Six levels, never collapsed into one success label. A pending claim has no executed artifact and is excluded from the executive narrative.
