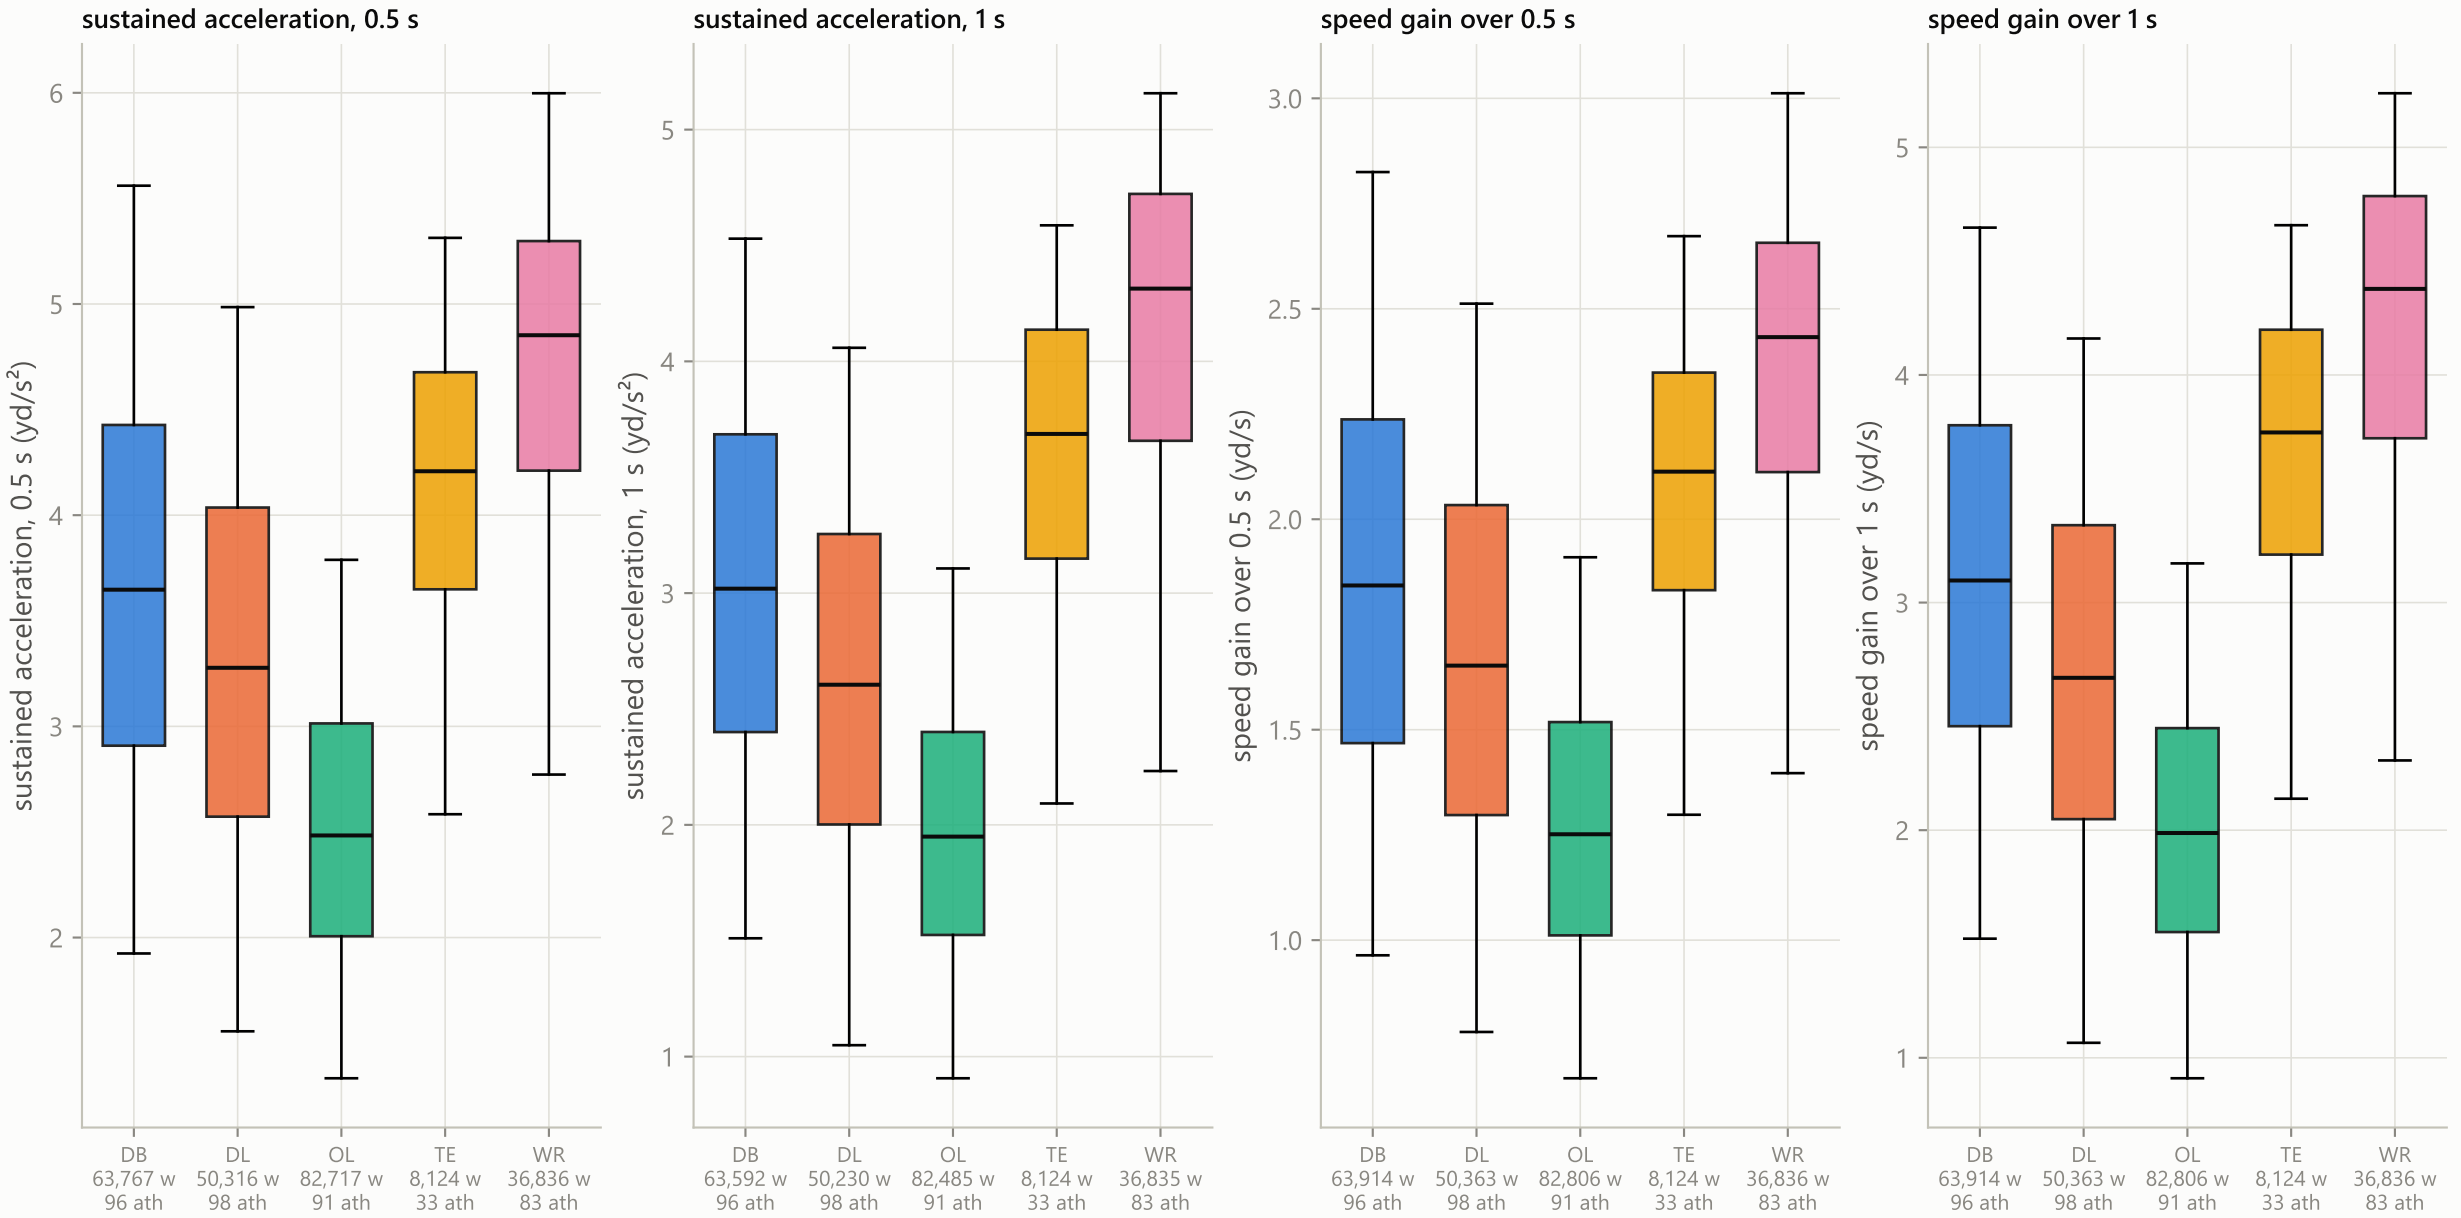
Sustained acceleration and speed gain by position group



Unit: eligible player-play window (w); athletes (ath) printed under each group — windows of one athlete are not independent. Box: quartiles and median; whiskers: 5th and 95th percentiles of the windows. Values are play measures from derived kinematics (Savitzky–Golay window 7 frames, order 2), post-snap frames only. Acceleration is a mean of d|v|/dt over the window; gain is the speed difference over it.
