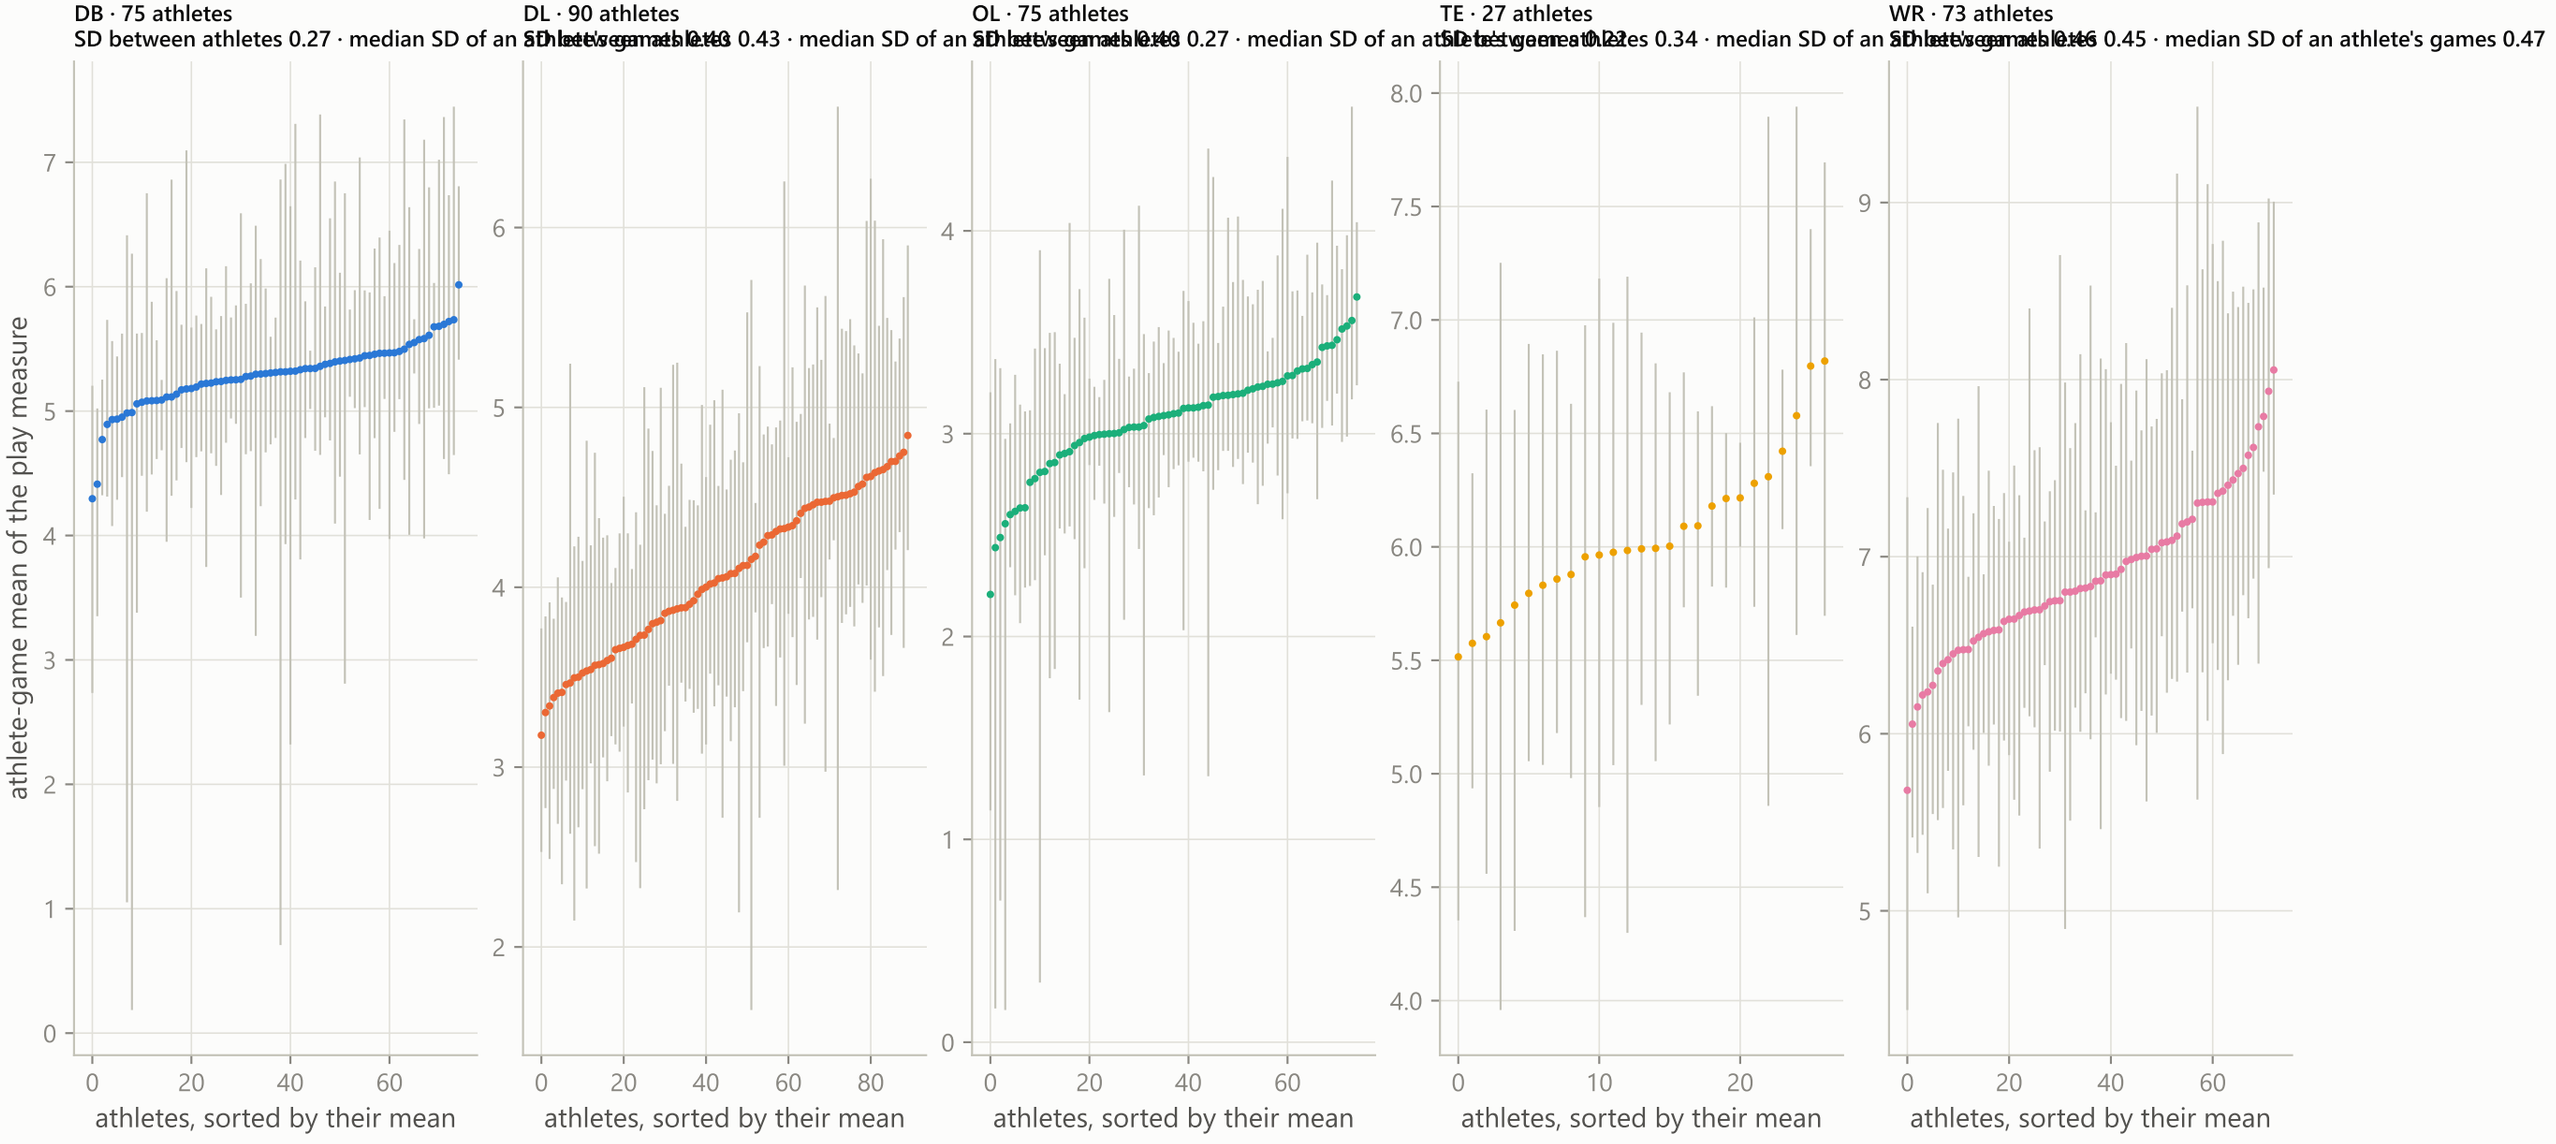
Within-athlete game variation against between-athlete spread



Outcome measure: O1.speed_sust10_p90. Unit: athlete (dot = mean of the athlete's game means; line = range of the game means). Athlete-games with ≥ 3 windows, athletes with ≥ 4 such games. When the lines are long relative to the spread of the dots, a few games cannot rank athletes. The split-half reliability of notebook 05B quantifies this; the figure shows it.
