Smoothing and boundary sensitivity of the play measures

Unit: eligible window (up to 125,419 per cell; every 2th game of a batch). Columns: sg<window>p<order> = alternative Savitzky–Golay filter; boundary_incl = primary filter with windows touching filter-edge frames kept. Primary: sg7p2, edge windows excluded. A measure whose level moves with the filter is a property of the filter as much as of the athlete; athlete-level rank agreement is tested in notebook 05B.
