Tracked exposure against observed movement opportunities

Tracked exposure against observed opportunity, per athlete

Opportunity rate: windows with the outcome defined / eligible windows

Left, unit: athlete (count per position in the legend); dashed line: the primary exposure threshold (50 windows). An athlete on the diagonal has the conditional outcome on every eligible window; athletes far below it were tracked but rarely in the situation the outcome needs. Right, unit: eligible window; composites have no rate. Frequency of opportunity (this figure) is kept apart from movement conditional on an opportunity (the outcome values).
