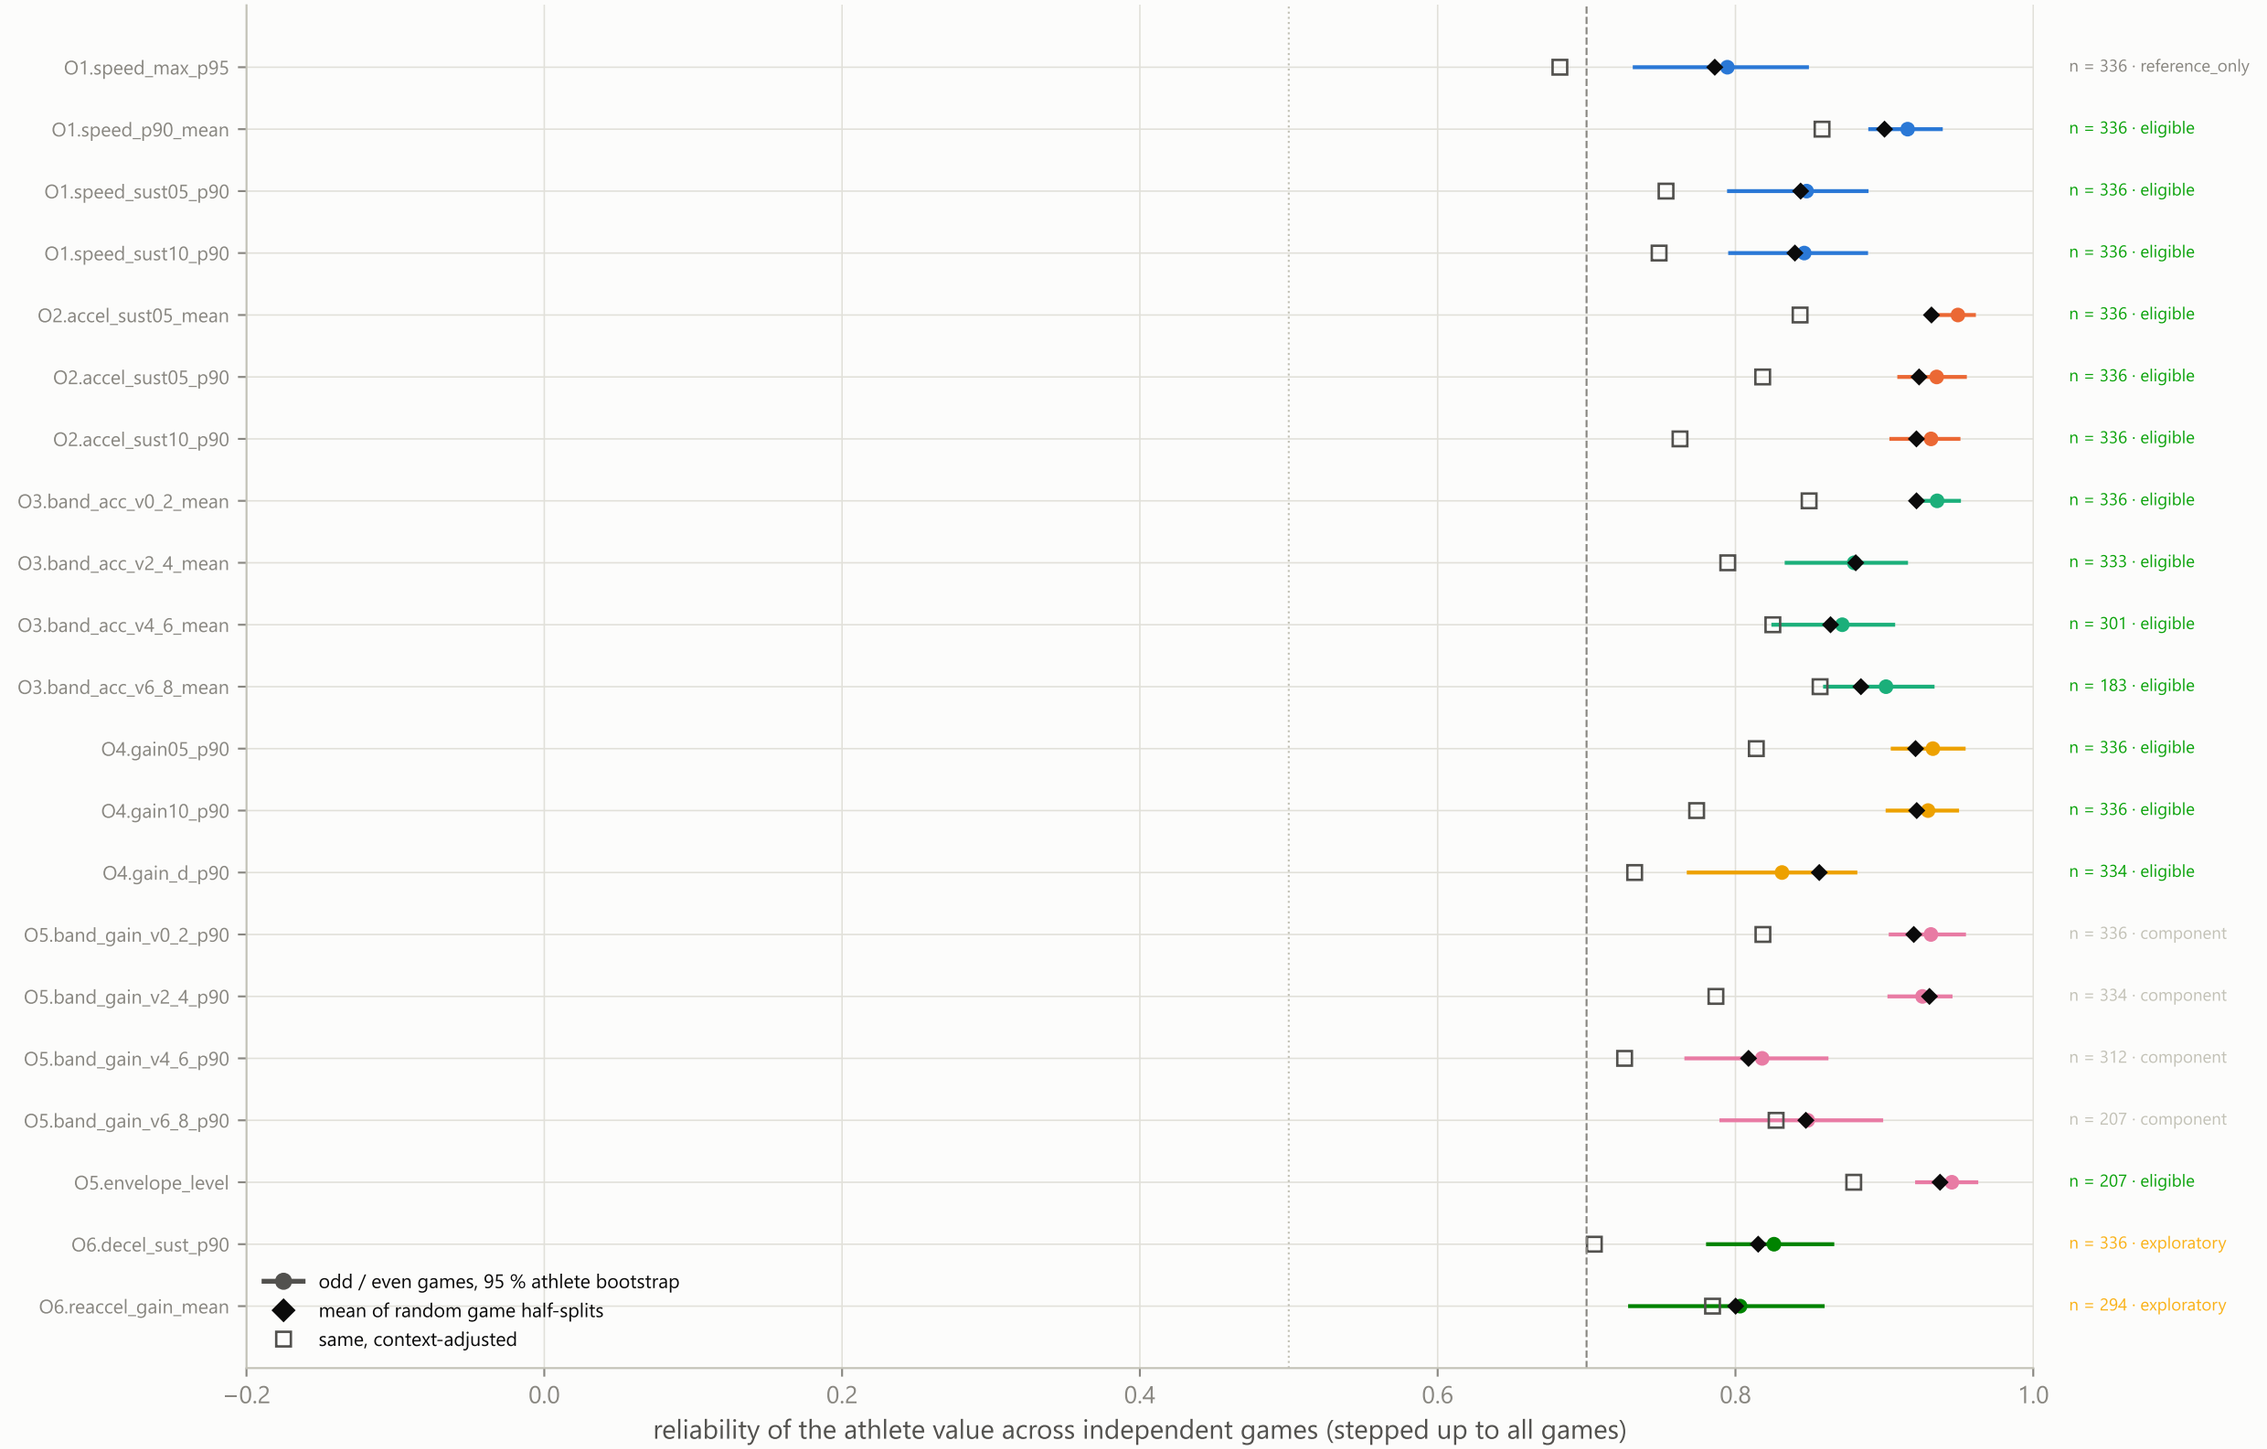
Reliability of the candidate NFL movement outcomes across games



Unit: athlete with ≥ 50 eligible windows (n at the right), position-group means removed. Halves are sets of whole GAMES of the athlete, never frames or plays; the interval resamples athletes. Reference lines 0.7 (dashed) and 0.5 for the lower bound (dotted) are heuristics. Colour: outcome family O1–O6. Reliability shows that a value repeats for an athlete; role and usage repeat too.
