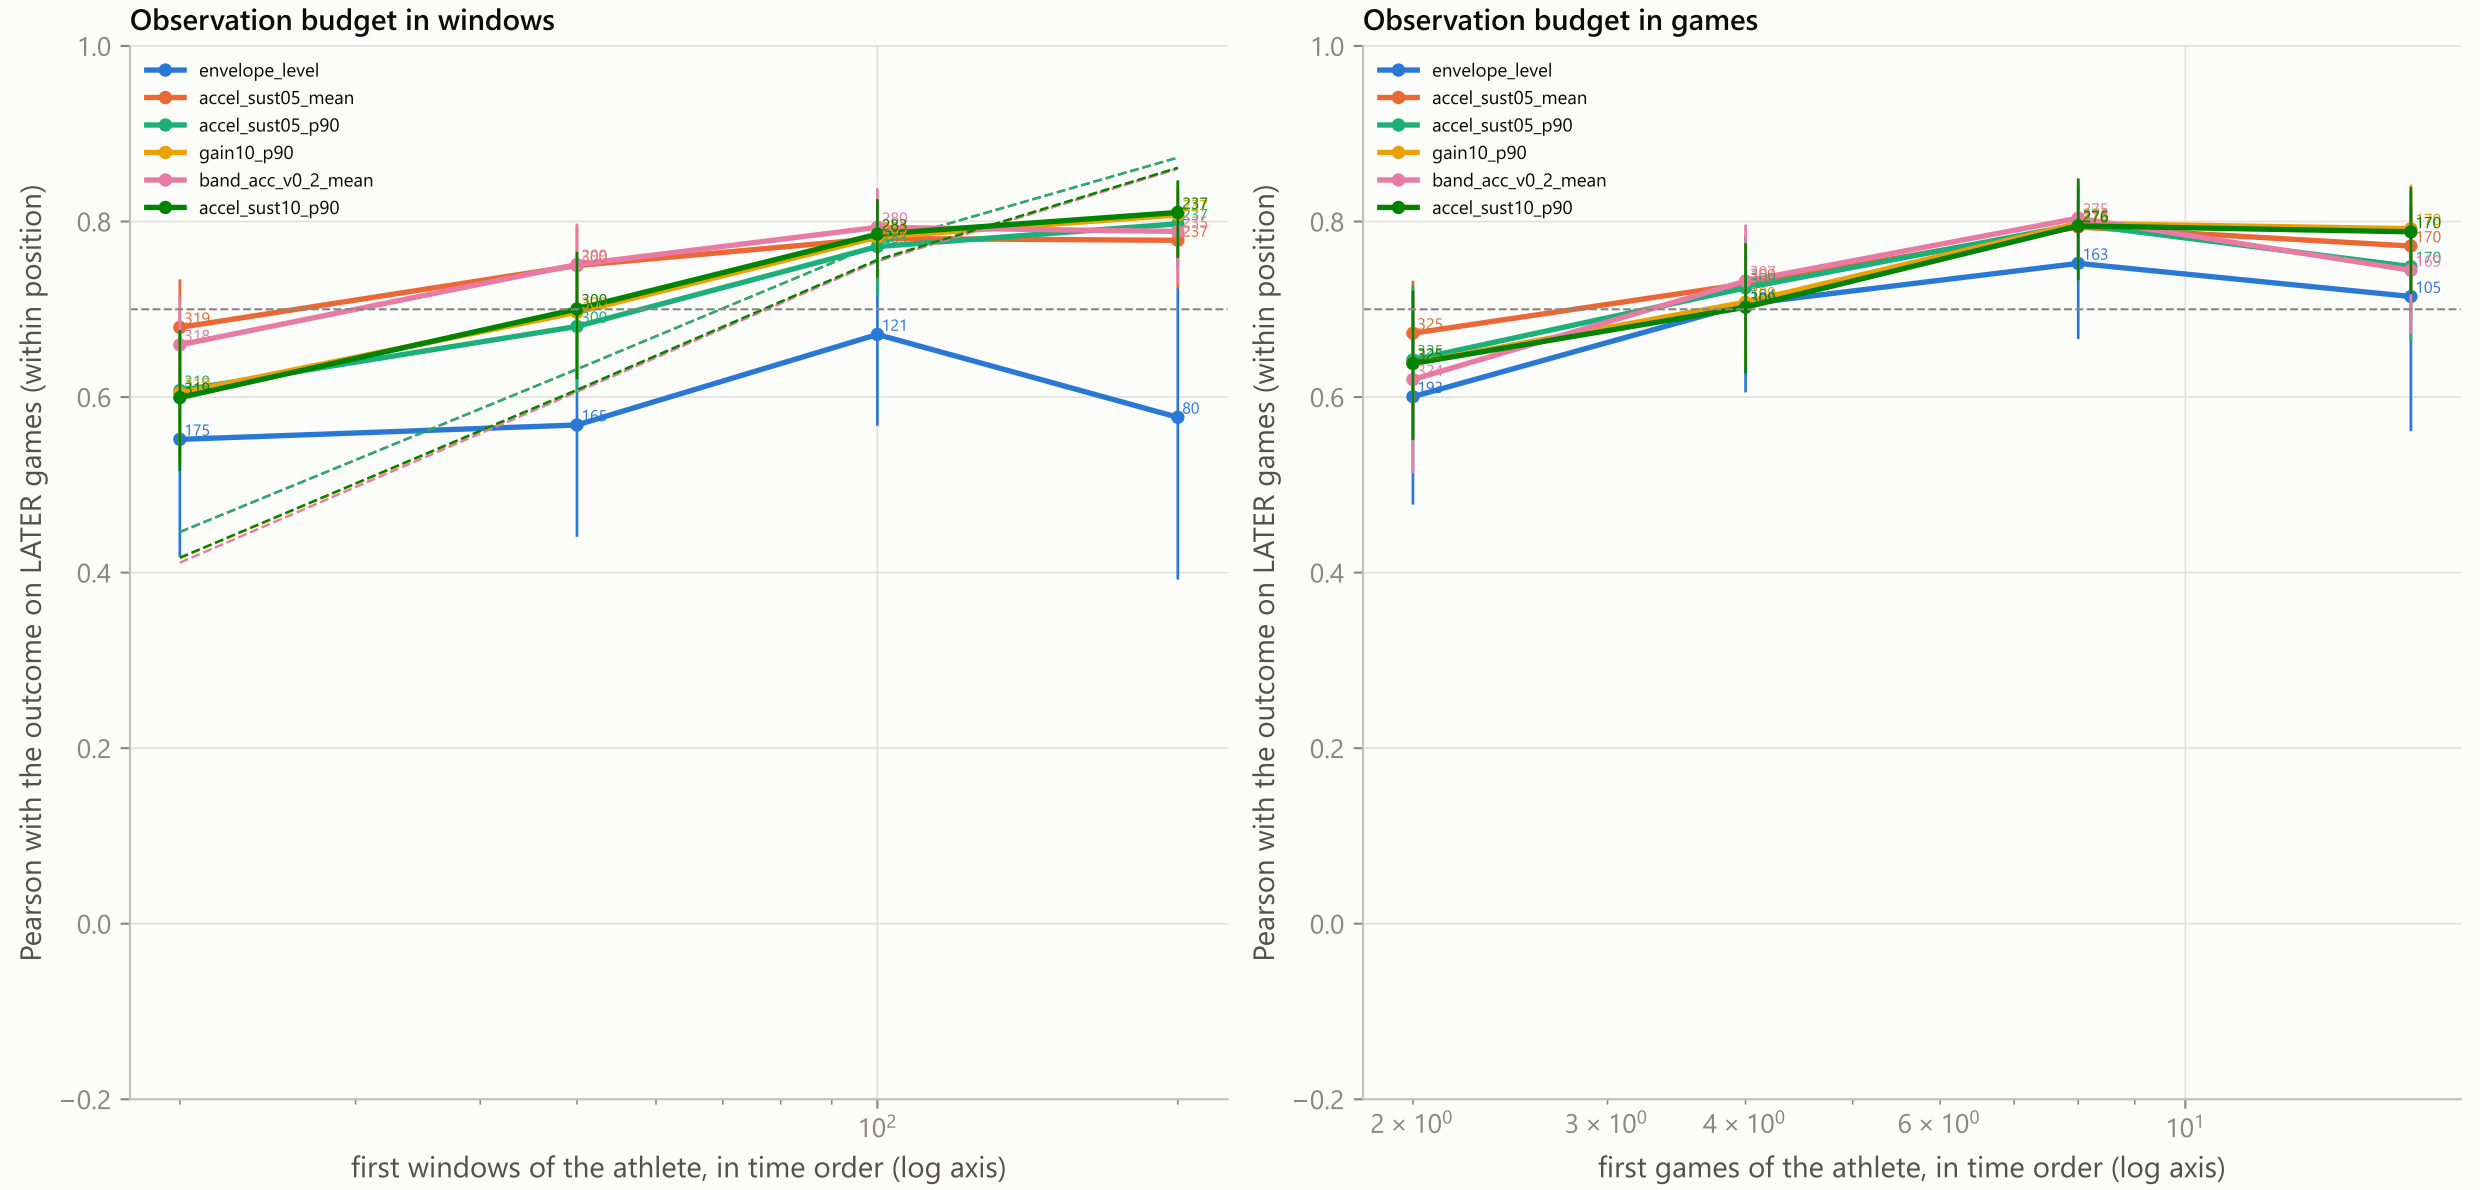
Reliability against observation budget



Unit: athlete (count beside each point) with the budget and ≥ 50 windows in games played strictly after it. Solid: correlation between the outcome on the first N windows (or G games) and on the later games, 95 % athlete bootstrap — attenuated by the noise of BOTH sides, so a lower bound of the reliability of the first-N value. Dashed (windows panel): projection from the variance components of the play measure, which describes an athlete MEAN. High reliability on all windows says nothing about the first 20.
