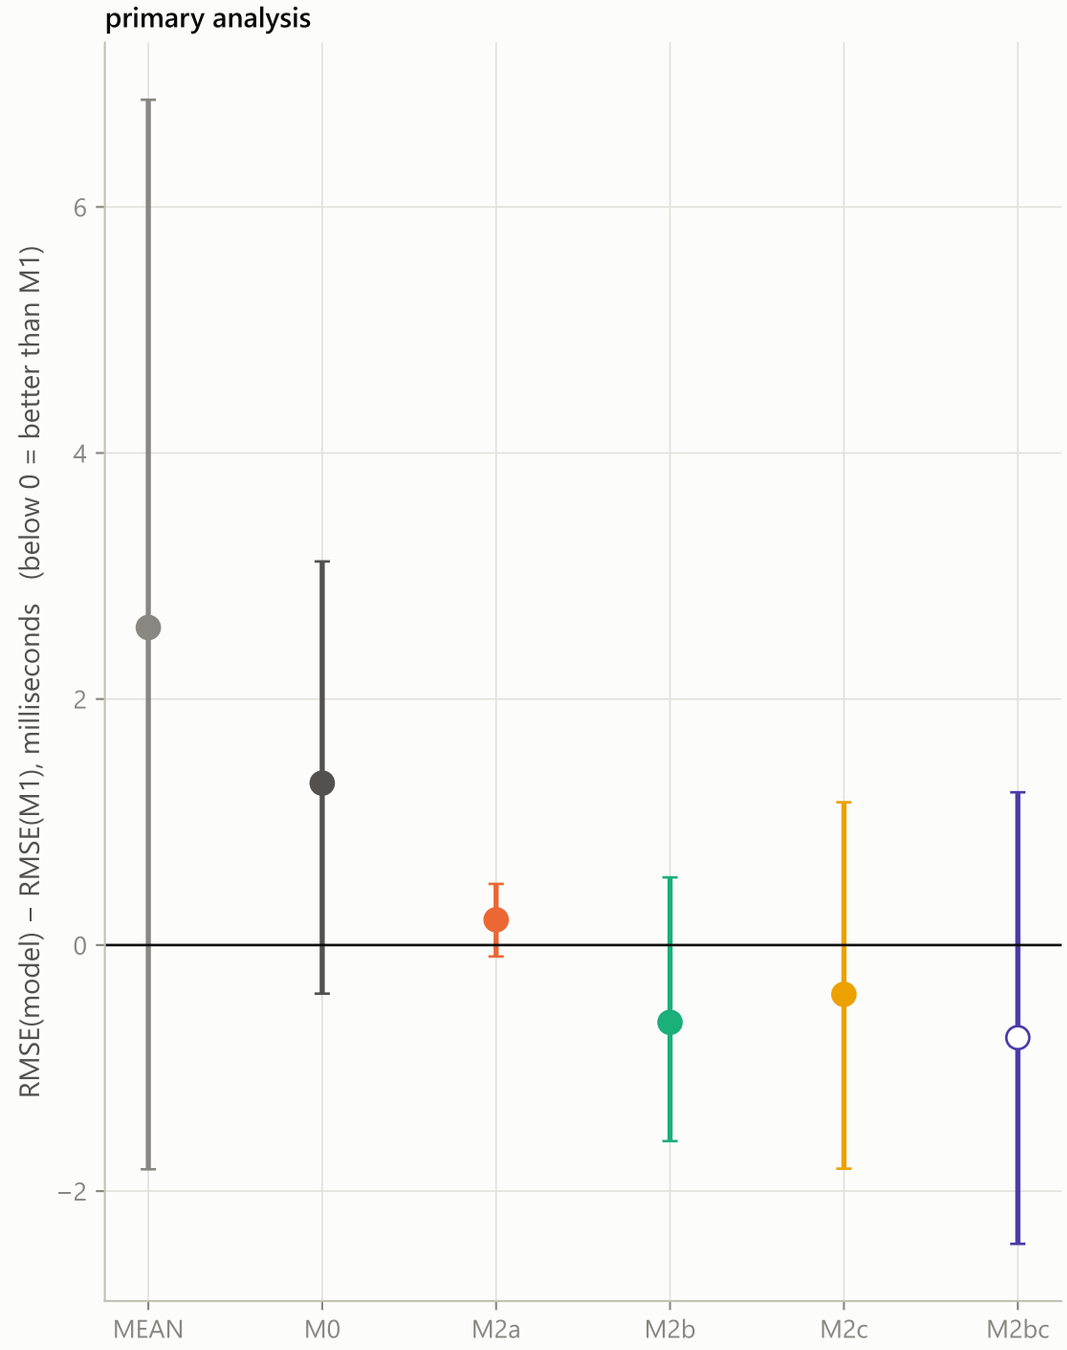
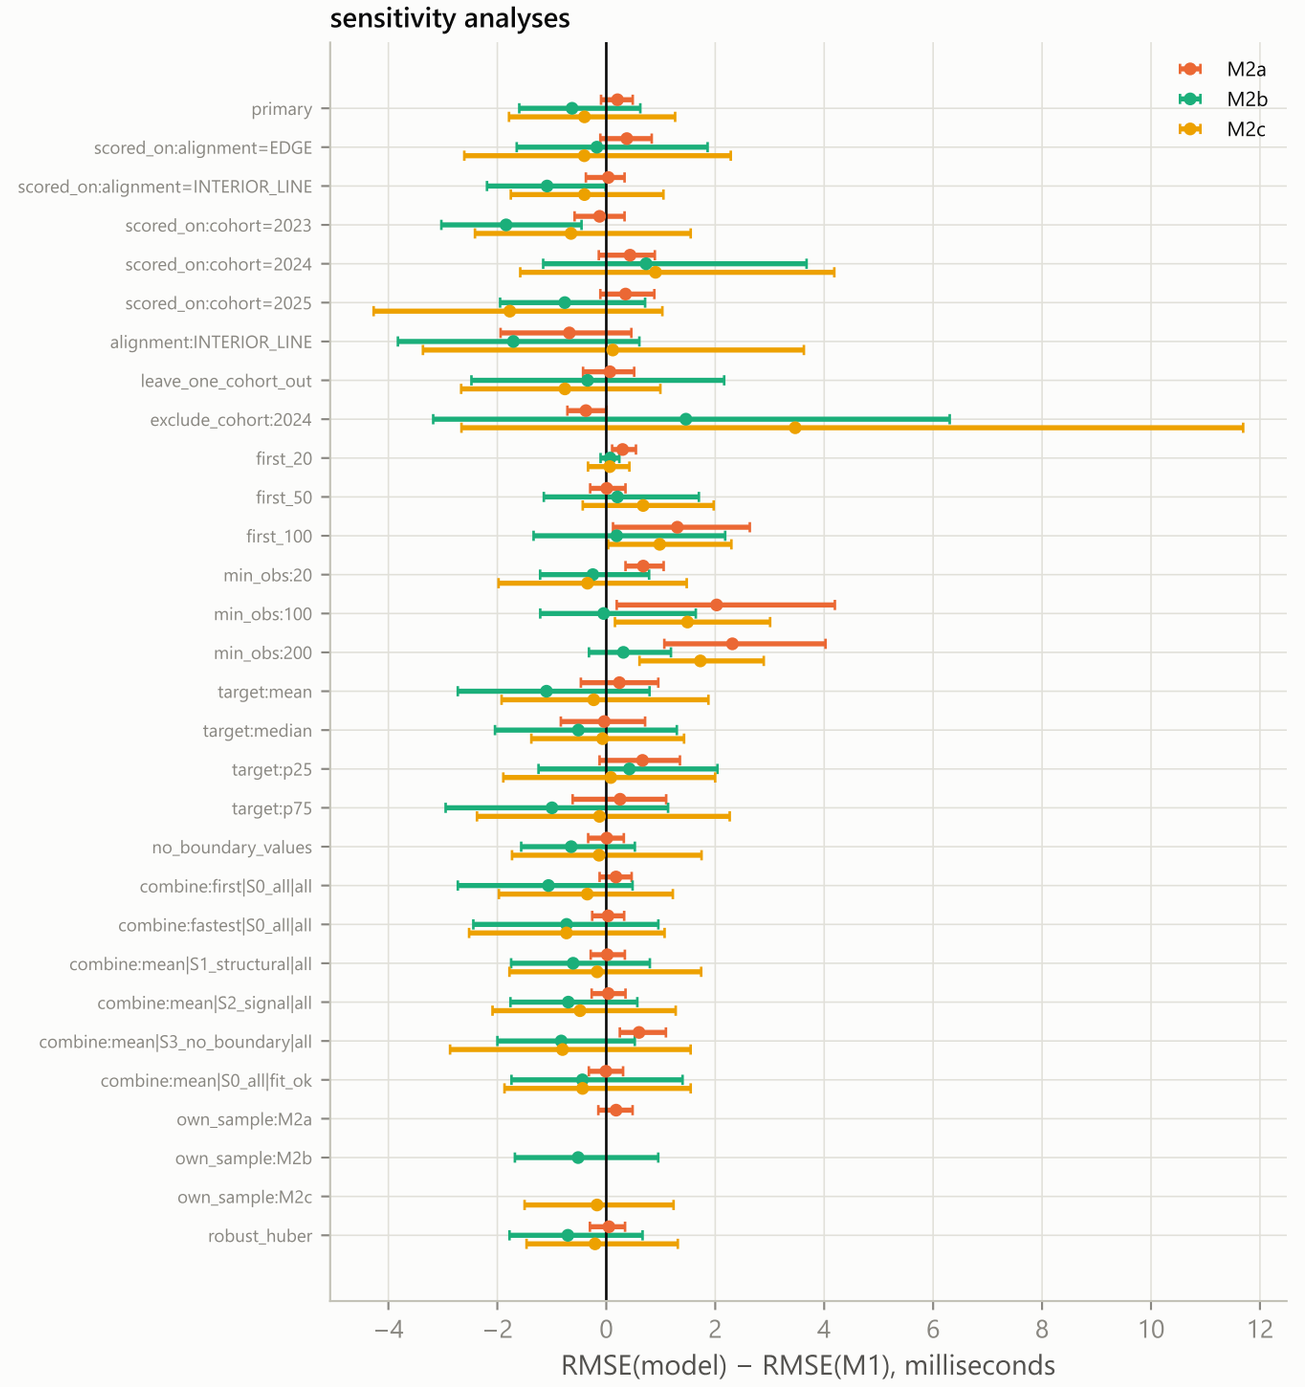
Does Combine tracking add anything beyond the official tests?





Unit: athlete. Paired difference in out-of-fold RMSE on identical athletes and folds; bars = 95 % athlete bootstrap. An interval that contains 0 is no evidence of a gain.
Right: each row refits every model under one changed condition (or scores the primary fit on a subset, 'scored_on'); sample sizes differ between rows and are in sensitivity_analyses.csv. Hollow marker = exploratory. VENDOR DEFINITION UNRESOLVED: the endpoint is an opaque number; no direction or football meaning is implied.
