Scout report — Anthony Bradford

OL · Which parts of a measured profile correspond to common NFL movement demands?

Descriptive scouting information from Combine tracking. No value on this page predicts NFL performance: in this project, tracked Combine features did not improve held-out prediction of NFL movement or receiver separation beyond official testing. Use it to decide what to examine next — not to rank prospects.

Observation

- Anthony Bradford (OL, class 2023): official forty 5.08 s, 10-yard split 1.74 s, weight 332 lb.
- [Uncertain difference] Anthony Bradford — band acceleration 2 → 4 yd/s: 4.60 yd/s² ± 0.61; raw position percentile 44 of 94 (for times, lower = quicker).
- [Uncertain difference] Anthony Bradford — band acceleration 4 → 6 yd/s: 3.73 yd/s² ± 0.61; raw position percentile 28 of 94 (for times, lower = quicker).
- Anthony Bradford — band acceleration 6 → 8 yd/s: 1.90 yd/s² ± 0.54; raw position percentile 32 of 94 (for times, lower = quicker).
- Anthony Bradford — speed at 10 yd: 7.59 yd/s ± 0.20; raw position percentile 23 of 94 (for times, lower = quicker).
- Anthony Bradford — speed at 20 yd: 9.11 yd/s ± 0.11; raw position percentile 74 of 94 (for times, lower = quicker).
- Anthony Bradford — speed at 30 yd: 9.30 yd/s ± 0.12; raw position percentile 52 of 94 (for times, lower = quicker).
- Anthony Bradford — speed development 4 → 8 yd/s: 1.59 s ± 0.15; raw position percentile 67 of 94 (for times, lower = quicker).
- Anthony Bradford — tracked top speed (p95): 9.34 yd/s ± 0.12; raw position percentile 49 of 94 (for times, lower = quicker).

Confidence

- Anthony Bradford — band acceleration 2 → 4 yd/s: range 4.48–4.71 yd/s² over 2 attempts.
- Anthony Bradford — band acceleration 4 → 6 yd/s: range 3.72–3.73 yd/s² over 2 attempts.
- Anthony Bradford — band acceleration 6 → 8 yd/s: range 1.84–1.95 yd/s² over 2 attempts.
- Anthony Bradford — speed at 10 yd: range 7.56–7.63 yd/s over 2 attempts.
- [Uncertain difference] Not repeatable enough to describe an athlete: band acceleration 2 → 4 yd/s, band acceleration 4 → 6 yd/s.
- Anthony Bradford: recording evidence tier 'high'.

Potential football relevance

- OL athletes show 81.4 'acceleration from low speed' episodes per 100 eligible player-plays (67,409 episodes, 90 athletes) — the observed game demand physically closest to early acceleration (first steps, below about 4 yd/s).
- [Missing observation] The NFL demand closest to late acceleration and high speed (above about 6 yd/s) ('transition_high'): Too few observed NFL episodes for this position and demand to describe it (support rule of the 09A atlas).
- OL athletes show 2.7 'acceleration from intermediate speed' episodes per 100 eligible player-plays (2,208 episodes, 83 athletes) — the observed game demand physically closest to mid-sprint speed development (about 4 to 8 yd/s).
- A physical correspondence only: the football advantage of the measured difference has not been established.
- Anthony Bradford — acceleration from low speed: Combine value at or above 99 % of observed NFL episodes of the position [95, 100] over 2 shared dimension(s). Descriptive similarity, not a prediction.
- Anthony Bradford — acceleration from intermediate speed: Combine value at or above 100 % of observed NFL episodes of the position [100, 100] over 1 shared dimension(s). Descriptive similarity, not a prediction.

- [Measurement mismatch] braking and deceleration: This NFL movement demand has no physical analogue in the forty-yard dash. The Lab makes no statement about it.
- [Measurement mismatch] acceleration following deceleration: This NFL movement demand has no physical analogue in the forty-yard dash. The Lab makes no statement about it.
- [Measurement mismatch] directional redirection: This NFL movement demand has no physical analogue in the forty-yard dash. The Lab makes no statement about it.
- [Measurement mismatch] repeated speed-change sequence: This NFL movement demand has no physical analogue in the forty-yard dash. The Lab makes no statement about it.
- [Measurement mismatch] speed maintenance: This NFL movement demand has no physical analogue in the forty-yard dash. The Lab makes no statement about it.
- Anthony Bradford — sustained high-speed running: Combine value at or above 100 % of observed NFL episodes of the position [100, 100] over 1 shared dimension(s). Descriptive similarity, not a prediction.
- [Measurement mismatch] acceleration from intermediate speed (partially physically comparable): 2.7 episodes per 100 eligible OL player-plays (83 athletes) — same dimension(s) acc_4_6, acc_6_8, different movement state — same speed bands; in the forty the athlete passes through the band once, already accelerating.
- [Measurement mismatch] sustained high-speed running (partially physically comparable): 0.1 episodes per 100 eligible OL player-plays (29 athletes) — same dimension(s) top_speed, different movement state — largest speed reached: tracked top speed of the forty against the peak speed of the episode.

Next film review

- [Additional data needed] Film — review Anthony Bradford on the first steps of a pull or a set (early acceleration (first steps, below about 4 yd/s)).
- [Additional data needed] Film — review Anthony Bradford on screens and long pursuit after a turnover (late acceleration and high speed (above about 6 yd/s)).
- [Additional data needed] Film — review Anthony Bradford on pulls and climbs to the second level (mid-sprint speed development (about 4 to 8 yd/s)).

Additional testing

- [Additional data needed] Early acceleration (first steps, below about 4 yd/s) — timed starts over 0–5 and 0–10 yd with split timing, at least two repetitions, recorded from before the first movement.
- [Additional data needed] Late acceleration and high speed (above about 6 yd/s) — a longer sprint or flying 20-yard segment, because 40 yards can end before top speed is reached.
- [Additional data needed] Mid-sprint speed development (about 4 to 8 yd/s) — rolling-start (flying) 10-yard segments entered at a controlled speed, so the 4 → 8 yd/s band is measured directly.
- A proposed test is a candidate way to measure a demand the forty does not describe. Its value for evaluating NFL prospects has not been established and would need prospective evidence.

Cannot conclude

- Which prospect will perform better in the NFL: no tracked Combine feature improved held-out prediction of NFL movement (Milestone 06) or receiver separation (Milestone 08B) beyond official testing.
- A draft order or a value judgement: the Lab describes measurements and does not rank prospects.
- That a physical similarity to an NFL demand means the demand will be met in pads, in traffic or late in a game.
- That a measured Combine difference causes a football outcome, or that training it would change one.
