Position-coach report — Ladd McConkey vs Isaiah Bond

WR · Is a tracked acceleration difference repeatable?

Descriptive scouting information from Combine tracking. No value on this page predicts NFL performance: in this project, tracked Combine features did not improve held-out prediction of NFL movement or receiver separation beyond official testing. Use it to decide what to examine next — not to rank prospects.

Observed movement phases

- [Uncertain difference] Initial acceleration: band acceleration 2 → 4 yd/s 6.95 (Ladd McConkey) vs 5.23 (Isaiah Bond) yd/s², difference -1.72 [-3.05, -0.40] — inside its measurement uncertainty — not a difference.
- [Uncertain difference] Early speed development: band acceleration 4 → 6 yd/s 5.61 (Ladd McConkey) vs 4.95 (Isaiah Bond) yd/s², difference -0.66 [-1.95, +0.63] — inside its measurement uncertainty — not a difference.
- [Uncertain difference] Intermediate speed development: speed development 4 → 8 yd/s 0.79 (Ladd McConkey) vs 0.93 (Isaiah Bond) s, difference +0.14 [-0.01, +0.29] — inside its measurement uncertainty — not a difference.

Physical demand in games

- No demand profile attached.

Film to cut up

- No tracking-based film prompt: review the prospect(s) on film and official testing as usual.

Targeted testing

- A proposed test is a candidate way to measure a demand the forty does not describe. Its value for evaluating NFL prospects has not been established and would need prospective evidence.

Limits

- That a physical similarity to an NFL demand means the demand will be met in pads, in traffic or late in a game.
- That a measured Combine difference causes a football outcome, or that training it would change one.
