General-manager summary — Ladd McConkey vs Isaiah Bond

WR · Is a tracked acceleration difference repeatable?

Descriptive scouting information from Combine tracking. No value on this page predicts NFL performance: in this project, tracked Combine features did not improve held-out prediction of NFL movement or receiver separation beyond official testing. Use it to decide what to examine next — not to rank prospects.

Decision

- Tracking adds no measured difference here: evaluate on film and official testing as usual.

What was measured

- No difference larger than its measurement uncertainty.

Strength of evidence

- 0 of 4 tested feature(s) differ by more than the uncertainty of the difference (repeat-attempt variation of both athletes; about 5 % of features would by chance alone).
- Distinguishable but on a feature not repeatable enough to describe an athlete: band acceleration 2 → 4 yd/s.
- Ladd McConkey: recording evidence tier 'low'. Recording evidence is below the high tier: the measurement is shown, with that caveat.
- band acceleration 2 → 4 yd/s as a measurement: repeat-attempt ICC 0.35 (unstable); R^2 on official times 0.08 (partly_beyond_stopwatch).

Evidence categories

- Uncertain difference: 7

Cannot conclude

- Which prospect will perform better in the NFL: no tracked Combine feature improved held-out prediction of NFL movement (Milestone 06) or receiver separation (Milestone 08B) beyond official testing.
- A draft order or a value judgement: the Lab describes measurements and does not rank prospects.
- That a physical similarity to an NFL demand means the demand will be met in pads, in traffic or late in a game.
- That a measured Combine difference causes a football outcome, or that training it would change one.
