General-manager summary — Anthony Bradford vs Mason McCormick

OL · Two prospects have similar forty times. What else differs?

Descriptive scouting information from Combine tracking. No value on this page predicts NFL performance: in this project, tracked Combine features did not improve held-out prediction of NFL movement or receiver separation beyond official testing. Use it to decide what to examine next — not to rank prospects.

Decision

- Additional evaluation is supported — as film review and a targeted test of the named phase(s), not as an input for ranking.

What was measured

- Early speed development: speed at 10 yd 7.59 (Anthony Bradford) vs 9.10 (Mason McCormick) yd/s, difference +1.51 [+1.23, +1.79] — larger than its measurement uncertainty. On this measure the observed value favours Mason McCormick.
- Intermediate speed development: band acceleration 6 → 8 yd/s 1.90 (Anthony Bradford) vs 6.05 (Mason McCormick) yd/s², difference +4.15 [+3.39, +4.91] — larger than its measurement uncertainty. On this measure the observed value favours Mason McCormick.
- Maximum tracked speed: tracked top speed (p95) 9.34 (Anthony Bradford) vs 9.56 (Mason McCormick) yd/s, difference +0.22 [+0.04, +0.40] — larger than its measurement uncertainty. On this measure the observed value favours Mason McCormick.

Strength of evidence

- 5 of 8 tested feature(s) differ by more than the uncertainty of the difference (repeat-attempt variation of both athletes; about 5 % of features would by chance alone).
- Distinguishable but on a feature not repeatable enough to describe an athlete: band acceleration 2 → 4 yd/s, band acceleration 4 → 6 yd/s.
- Mason McCormick: recording evidence tier 'low'. Recording evidence is below the high tier: the measurement is shown, with that caveat.
- Largely the same information as official testing: speed at 20 yd.

Evidence categories

- Measured difference: 3
- Uncertain difference: 4
- Missing observation: 1
- Additional data needed: 6

Cannot conclude

- Which prospect will perform better in the NFL: no tracked Combine feature improved held-out prediction of NFL movement (Milestone 06) or receiver separation (Milestone 08B) beyond official testing.
- A draft order or a value judgement: the Lab describes measurements and does not rank prospects.
- That a physical similarity to an NFL demand means the demand will be met in pads, in traffic or late in a game.
- That a measured Combine difference causes a football outcome, or that training it would change one.
